Period Report
1 January to 30 June 1945

MEDICAL DETACHMENT
(SPECIAL TROOPS) THIRD ARMY
APO 403 U S ARMY

ANNUAL REPORT OF MEDICAL DEPARTMENT ACTIVITIES

SUMMARY OF EARLY HISTORY

The Medical Detachment, Special Troops, Third United States Army, was activated in December 1942 at Fort Sam Houston, Texas. After spending fifteen months in training at that post, the Detachment moved to Camp Shanks, New York and sailed for the United Kingdom in March 1944.

In the United Kingdom training continued and the Detachment was broken into forward and rear sections so as to provide adequate medical service for Army Headquarters when it would become operational on the continent. In July 1944 both sections moved to the continent with their respective echelons of Army Headquarters and provided medical service on that basis until the end of the war.

In May 1945 the forward section opened in Bad Tolz, Germany and in June the rear section opened in Munich, Germany. Operations continued like this until late December 1945 when Army Headquarters was consolidated at Bad Tolz and the Medical Detachment was together again for the first time in eighteen months operating but one dispensary.

OPERATIONS

As 1946 began the Medical Detachment was operating one dispensary in Bad Tolz for Third Army Headquarters. This dispensary also provided medical and dental care for several other units stationed in the vicinity of Bad Tolz.

During the last week of March, the detachment moved to Heidelberg, Germany where it took over the installations of the Medical Detachment, Special Troops, Seventh United States Army. These included two dispensaries, one in the enlisted men's billet area and one in the Command Post area which is primarily designed to take care of Officers, WACs and War Department Civilians. A four-chair dental clinic is located at the Command Post dispensary. The detachment has been fortunate in always having at least three dental officers assigned or attached, including a Dental Operating Detachment and a Dental Prosthetic Detachment. A complete dental laboratory, including an X-Ray unit, has been maintained, thus affording the personnel attached to Third Army Headquarters complete dental care.

PERSONNEL

As the year began the unit was at T/O strength in both officers and enlisted men. In March, however, an almost one hundred percent (100%) turnover was effected among the enlisted personnel. This was serious as the majority of the men received had not had medical basic training. Due to the volume of work, it was necessary to train these men "on-the-job" and very little time could be devoted to formal lectures and instruction. This situation was somewhat alleviated upon moving to Heidelberg and consolidating with Seventh Army. Most of the men gained in this move were well-trained and were able to supervise and teach the new men. After that redeployment offered no great problem

as it was gradual and trained replacements were received.

Officer personnel changed one hundred percent (100%) during the year but the changes were gradual and no interruption in medical coverage resulted.

EQUIPMENT, SUPPLIES AND TRANSPORTATION

Major items of equipment are, for the most part, captured enemy equipment of good quality. The dental clinic has three complete Ritter units in excellent condition. The only major difficulty encountered has been in the matter of refrigeration for the two dispensaries. Two German electric refrigerators were on hand but most of the time they were not in working order. This was due to lack of parts and to inferior parts which burned out due to the fluctuating electrical current.

There were no major supply problems. Supplies were originally drawn from the Furth Medical Depot at Nurnberg which was an all day round-trip from Bad Tolz. After moving to Heidelberg, supplies were drawn from the Weinheim Medical Depot - a thirty minute run from Heidelberg. In May the supply system changed and the detachment began to draw from the 130th Station Hospital in Heidelberg.

Transportation has been adequate, the detachment being assigned two ambulances and two jeeps.

EVACUATION

Evacuation of patients has presented no problems. While in Bad Tolz the 58th Field Hospital, located at Bad Wiessee sixteen (16) miles away, was used. Special cases were taken to the 98th General Hospital in Munich, thirty (30) miles away. In Heidelberg all patients were sent to the 130th Station Hospital located in town.

TRAINING

No formal medical training was undertaken during the year due to the small number of men available for duty and the the large volume of work that had to be done. However, all new men were carefully supervised by the experienced technicians for variable periods of time until they became adept at doing the procedures required in a dispensary of this type.

Military training, consisting of drill, lectures on hygiene, sanitation, administration, motor maintenance, etc., attendance at training films, was conducted in conjunction with and under the supervision of Headquarters Company, Third Army.

HOUSING

In both Bad Tolz and Heidelberg the enlisted men were billeted in modern casernes and the officers in hotels and apartments. Laundry and bathing facilities have been adequate throughout the year. Modern shower facilities have been available. There was some shortage of hot water but this is a general condition throughout Germany due to the critical fuel situation.

In both locations the city water supplies have been chlorinated at the point they enter the city lines so that the tap water has been potable. This was possible because neither city suffered any bombing damage during the war.

MESSING

Enlisted men's messes were Type "A" and officer's Type "B". The two main messes at Patton Barracks in Heidelberg for enlisted men received numerous commendations throughout the year from every food and mess inspector who visited them. This was due mainly to the efficient work of the mess personnel and to the many fine items of equipment such as electric dishwashers, electric deep-fat fryers, electric meat cutters, etc., that they were able to procure.

Waste disposal presented no particular problems. Contracts were made with local farmers to haul the garbage away. They were required to dispose of the non-edible garbage in return for getting the edible scraps for feeding to their livestock.

PREVENTIVE MEDICINE

All medical personnel were immunized against diptheria in January and February. All personnel of the headquarters received their yearly booster shots in October and November. In December Schick testing was begun on all personnel in accordance with current directives.

The most important and troublesome skin disease encountered was scabies. The command averaged approximately two thousand (2000) men during the year and the dispensary treated four (4) to five (5) cases of scabies on the average each week. There were very few cases during the summer months but as fall began the rate began to climb. With the cooperation of Headquarters Company Commander, vigorous efforts were made to prevent the spread of the disease. All personnel having scabies were required to report to their commanding officer after treatment. They then received a complete issue of clean bedclothing including a mattress. The sheets and blankets were thoroughly laundered and the mattresses stored in a cool basement for a minimum of four (4) weeks before being reissued. Shortly after this program got under way the number of cases began to decrease.

During the summer months the dental service began to notice an alarming increase in the number of patients with Vincent's stomatitis. Upon their recommendation a program of weekly inspections of the many Army bars and clubs in the area was begun. Conditions were found to be sad in most instances. The greatest fault was the lack of proper washing facilities for the glasses and an insufficient supply of glasses. With the cooperation of Headquarters Commandant, heating units, soap and more glasses were provided for all bars. Personnel in charge of bars and clubs were properly instructed in bar sanitation. The effect of this program was felt almost immediately, the incidence of this disease dropping almost fifty percent (50%) in the first two weeks, and at year's end only a very few cases of Vincent's stomatitis were being seen in the dental clinic.

VENEREAL DISEASE

In Bad Tolz, for the first three months of the year, the venereal disease rate averaged sixty-nine per thousand per annum (69/1000/annum). This low rate, for the European Theater, was probably due to the fact that Bad Tolz was a

small town and rather tightly controlled so that opportunities were at a minimum.

Upon moving to Heidelberg the rate jumped to one hundred and forty-two per thousand per annum (142/1000/annum) for the first three months and then fell slightly to one hundred and thirty-nine per thousand per annum (139/1000/annum) for the next three months. This rise may be attributed to the fact that 1) the large city made supervision of the men more difficult; 2) these were the spring and summer months; and 3) the redeployment problems of March and April found the command with almost entirely new personnel -- young boys fresh from the States and bent on sowing their wild oats as soon as possible.

During the summer months a program of lectures and posters was instituted with no apparent effect. In September the Medical Detachment began, with the approval and cooperation of the local Military Government, a series of vice raids. All unescorted girls found loitering around the clubs were picked up and examined in the local clinic. The number of positive cases of gonorrhoea ran as high as fifty percent (50%) in some of these raids. In November, a social pass system went into effect in the clubs and the number of loiterers dropped to almost nothing. At the same time venereal disease lectures were stopped and posters were taken down on the theory that the less said about venereal disease to impressionable young men, the less they would be inclined to find out for themselves if it were true. As a result of these measures the rate for the last three months of the year fell sharply to ninety-six per thousand per annum (96/1000/annum).

PREVENTIVE MEDICINE
HISTORY - 1946

The Preventive Medicine sub-section was responsible for the recommendation and supervision of an adequate program of preventive medicine for the command during the year 1946. The specific duties of this sub-section included the following:

Investigation of any situation which threatened the health of the command and initiation of required corrective measures.

Control of venereal disease.

Publication of directives concerning communicable disease and sanitation.

Initiation of corrective measures for sanitary deficiencies brought to attention by routine or special sanitary reports.

Routine inspections of the units of the command to insure compliance with directives concerning health and sanitation.

Maintenance of technical supervision and inspection of sanitary engineering projects of Third U.S. Army with particular reference to insuring a potable water supply, satisfactory sewage and garbage disposal, and adequate methods and materials for handling disinfestation problems.

Inspection of displaced persons, civilian internees, and pr war camps and hospitals to insure maintenance of the highest tertiary standards.

Cooperation and liaison with Military Government in the civilian public health problems which may affect U.S. troops.

Editing and consolidation of weekly statistical health monthly sanitary reports and determination of communicable for Third U.S. Army troops.

GENERAL INFORMATION CONCERNING THE PERIOD

This period, 1 January 1946 to 31 December 1946, was from the preventive medicine point of view. The beginning found redeployment continuing and redeployment criteria ly. Plans for medical care were altered as many times occupational troop basis and military communities. of one area to another was a continuous process. Young flood the theater. In March Continental Base Section hospitals. On 1 April Third U.S. Army took over the Seventh U.S. Army. Dependents began arriving in the during April, swelling to thousands by the end of the remainder of U.S. hospitals under Third U.S. over to Continental Base Section.

Civilian public health became a more important problem because of the increasing number of indigenous civilian employees in Army installations and dependents' homes and the closer duty and social contacts between troops and civilians. Though close cooperation with Military Government public health agencies had always been practiced, it was decided to place an interested Medical Corps Officer as liaison officer with the Public Health Branch of each Land. This was done in October and November; the results have been most encouraging, particularly in the field of venereal disease control.

Tuberculosis, venereal disease, diphtheria, intestinal diseases, and scabies occurring among civilians were the most important diseases from the military preventive medicine point of view.

Tuberculosis is the most grave public health danger among German civilians. Overcrowding, inadequate hospital and treatment facilities, malnourishment, and a high rate of infection contribute greatly to the increasing danger of this disease.

Civilian venereal disease increased up until September and since then has shown a gradual decline. The syphilis-gonorrhea ratio has shown a continued increase throughout the period.

Diphtheria has a rather constant civilian rate of 2.5 to 3 per thousand per annum. This is high compared to U.S. standards but has not risen appreciably among civilians. It is to be expected that there are many carriers among the civilian population.

Due to damaged municipal water systems, diminished sanitary standards, the use of human excreta for fertilizer, there has been an increase in intestinal diseases among German civilians. Outbreaks of disease are to be expected among civilians until the above factors are improved or corrected.

The actual incidence of scabies among the Germans is unknown but it is estimated to be very high. Until such time as adequate sanitary and therapeutic facilities are available this disease will continue to be a reservoir of infestation for U.S. troops.

ADMISSIONS

The admission rate per thousand per annum was 955.6 (see Annex # and #). The rate exhibited the usual seasonal variations. In March there was a sudden drop due to the loss of fixed hospitals to Continental Base Section. In April the total admissions by cases were higher due to Third U.S. Army absorbing the troops of Seventh U.S. Army. There was an unnatural rise in the admission rate during the summer months of July, August, and September, principally due to the increase in the venereal disease rate. In November the admission rate dropped, due to the transfer of the remaining hospitals to Continental Base Section. Admissions for the year totalled 107,404.

Admissions for disease during the year totalled 100,369, a rate of 893 per 1000 per annum. Diseases accounted for 93.5 % of all admissions.

Admissions for non-battle injury for the year totalled 7,035, a rate of 62.6 per 1000 per annum. Non-battle injuries accounted for 6.5 %

of all admissions. Vehicle accidents were the primary cause of death and injury, accounting for approximately half the deaths due to injury; gunshot wounds, drowning, falls, alcoholism, explosions, burns, suicide, accidental electrocution, and stab wounds respectively accounted for the remaining principal causes of death due to non-battle injury. On 1 July 1946 the Third U.S. Army "Year Around Safety Program" was put into effect, appointing safety officers down to company level. Since August 1946, the rate for non-battle injury has manifested a downward trend, reaching the lowest point of the year in December.

CONTROL OF COMMUNICABLE DISEASE

The prevention and control of communicable disease was the primary interest of the Medical Inspector. Charts indicating the incidence and rate of all significant communicable diseases within the command are appended to this report. The rates quoted are computed from W.D. A.G.O. Forms 8-122 submitted by Third U.S. Army hospitals and dispensaries. The loss of all fixed hospitals in March, 1946 and of the evacuation and field hospitals in November has caused a marked reduction in rates of reportable diseases. In like manner, the rates given for the period when fixed and mobile hospitals were under Third U.S. Army control include cases from other than Third U.S. Army units; thus these rates cannot be interpreted as accurate disease rates for Third U.S. Army troops but, rather, they indicate trends. The following diseases were of special interest during the period herein reported:

DIPHTHERIA: Diphtheria was the most prevalent of the serious respiratory diseases. Telephonic reporting of confirmed diphtheria cases, and other serious respiratory disease, was required. The Preventive Medicine Section, Office of the Theater Chief Surgeon, Headquarters United States Forces European Theater was immediately notified by the installation making the diagnosis, and the unit concerned was contacted to insure that proper preventive measures were promptly instituted and reports submitted.

Diphtheria is endemic among the German civilian population. In January diphtheria immunization was ordered for all dispensary and hospital personnel and all troops on duty at Prisoner of War, Displaced Persons, and Civilian Internee installations.

The Third U.S. Army rate for diphtheria for the period was 4.4 per thousand per annum. The incidence was greatest during the early part of the period. Sporadic outbreaks of diphtheria occurred among the troops throughout the period.

In February there were 21 cases hospitalized from the Constabulary School at Sonthofen, Germany. Immunization of all personnel was done; all mess attendants were cultured and a portable laboratory was used for this purpose. Immunization of all personnel was accomplished.

In April there was a diphtheria outbreak in Lengries involving the 2nd Cavalry Reconnaissance Squadron, 3511 Ordnance MAM Company and the 42 Cavalry Reconnaissance Squadron; 20 cases were hospitalized. Investigation revealed carriers among members of the 2nd Cavalry Reconnaissance Squadron and immunizations were completed. At the same time

22 cases were hospitalized from the 41 Reinforcement Battalion at Amberg, Germany.

In July there was an epidemic of 13 cases among the personnel of the Heidenheim Ordnance Technical Training Center. Investigation revealed deficiencies in the preparation and storing of food. These were corrected and immunizations were completed.

In October there were 6 cases hospitalized from the European Theater Intelligence School at Oberammergau, Germany. Investigation was made and immunizations of static and student personnel was accomplished.

In November there were 8 cases of diphtheria from the 33 Field Artillery Battalion and 5 cases from the 14 Constabulary Squadron in Darmstadt.

In October, Headquarters, United States Forces, European Theater, planned immunization of all susceptible U.S. personnel under the age of thirty-five (35). Due to delays in receiving the necessary supplies the program was not put into effect until late in November. At the end of the year most units had requisitioned and received supplies for the immunization program. There were 7.3 % of the troops immunized without use of the Schick test. 75.6 % of Third U.S. Army troops have been Schick-tested. Of those susceptible to diphtheria as manifested by the Schick test, 10.9 % have completed immunization and 76.8 % are in the process of completing immunization. It is expected that all susceptible Third U.S. Army personnel will have immunizations completed by 28 February, 1947.

TUBERCULOSIS: The rate for Third U.S. Army was 0.4 per 1000 per annum. The high rate of infection of the German civilian population and the slowness with which the disease manifests itself makes tuberculosis a continuing preventive medicine problem.

All foodhandlers in Third U.S. Army installations and household employees in dependents homes are X-rayed routinely. The troops have been oriented as to the high incidence of tuberculosis among the civilian population and the manner in which it is acquired.

Turnover of non-American hospitals to Military Government has been rapid during the period. This measure has aided greatly in providing more bed space for open tuberculosis cases, thus reducing the danger to troops.

INFECTIOUS HEPATITIS: Infectious hepatitis was not unduly prevalent; the rate varied from 2.2 to 15.6 per 1000 per annum. The rate for the year was 4.7 per 1000.

During the period 25 November - 30 December there was an outbreak of infectious hepatitis in the Ludwigsburg area; this area was occupied by troops of the 60 Infantry Regiment. From one (1) to eight (8) cases a day were reported during the period 9 - 22 December. Investigation revealed the probable source of the epidemic to be a non-potable municipal water supply that had been used four (4) to six (6) weeks prior to the outbreak. Strict water discipline was put into effect and cooperation with civilian public health authorities maintained. By 30 December there were a total of forty-four (44) cases of infectious hepatitis among U.S. personnel, including four (4) dependents. No other outbreaks of this disease have occurred.

INTESTINAL DISEASE: The incidence of intestinal disease was generally low. Army Regulations and current theater directives concerning the prevention of intestinal disease were enforced within units. The prevalence of these diseases among German civilians was emphasized to the troops; careful physical examinations and immunizations were completed on all indigenous personnel hired in Third U.S. Army installations as foodhandlers.

Though typhoid fever is endemic in Bavaria and two outbreaks of epidemic proportions occurred in that land, no cases of typhoid fever have occurred among Third U.S. Army troops. Likewise paratyphoid fever was endemic in Bavaria and reached epidemic proportions in Kreis Lichtenfels. There were two cases of paratyphoid fever reported in Third U.S. Army troops, one of which resulted in death. These were isolated cases and the source of the infection was not ascertained from the epidemiologic study.

An outbreak of food poisoning occurred among Special Troops, Headquarters, U.S. Constabulary in July. Twenty-six men were hospitalized. The disease was mild and, upon investigation, was attributed to contaminated rice pudding.

In November an outbreak of diarrhea occurred in the 9 Medical Battalion, Goggingen, Germany. Eighty-four (84) men were afflicted, only five requiring hospitalization. Investigation revealed inadequate dishwashing facilities. Corrective measures were instituted and there have been no recurrences. No other serious outbreaks of intestinal disease occurred during the period.

During the period emphasis has been placed on current maintenance of the immunization status of all troops, rigid sanitary standards implanted by frequent inspections, water discipline, and troop education concerning the hazards of any break of sanitary discipline.

SCABIES: Scabies has constituted one of the major preventive medicine problems throughout the year. The rate for scabies was 39.6 per 1000 per annum. This represents the hospitalized incidence and is in itself excessive. Inspections and special reports have revealed a duty-status scabies incidence many times this rate.

Many factors enter into the cause of this high incidence of scabies:

Contact of troops with a scapless, heavily infested German civilian population.

Lack of personal hygiene among the many low caliber troops.

Lack of adequate basis training of young replacements coming into the theater.

Reluctance of many soldiers to bathe regularly unless the facilities are ideal; reduction of fuel has restricted the availability of warm bath-rooms or shower rooms and hot water.

Limited laundry and dry cleaning facilities preventing frequent changes of clothing and bedding.

To combat this infestation, emphasis has been placed on early recognition and adequate treatment. Commanders have been instructed to provide adequate bathing, laundry, and dry cleaning facilities for troops. Troop orientation concerning scabies has been stressed. The Commanding General has emphasized the importance of the above measures and the maintenance of high standards of personal hygiene among troops in conferences with unit and major commanders. Stress has likewise been placed on the elimination of undesirable personnel according to the provisions of Letter,

Headquarters Third United States Army, AG 250.1 GNMCA-11, subject: "Elimination of Undesirable Personnel", dated 7 November 1946.

Until such time as normal sanitary facilities and proper therapeutic facilities are available for the source of this infestation, the German civilian population, the presence of scabies among troops will continue to be a problem.

TYPHUS: There were no cases of typhus in Third United States Army troops during the period of this report. On 2 November 1946 typhus reimmunization was discontinued except for personnel employed in DP or PW reception stations and those personnel traveling to destinations east of 18° east longitude. (See Annex #)

INFLUENZA: There were no outbreaks of influenza among Third United States Army troops during the period. In accord with War Department policy, influenza vaccination was not performed. Influenza control officers were appointed and influenza observation stations were established at all Third United States Army hospitals on 5 October, 1946. These officers and the Third United States Army Influenza Control Officer attended a one-day intensive course of instruction at the Fourth Medical Laboratory, Darmstadt, Germany. At the close of the period there was only one influenza control station for United States troops, under control of Third United States Army; the Sonthofen Station Complement Unit Dispensary.

VENEREAL DISEASE CONTROL 1946

Venereal disease control was a major problem for the entire year 1946 in the Third United States Army. The sharply rising incidence of venereal disease which began after VE Day in May 1945, continued unabated into 1946. In January 1946 the rate for Third Army troops reached 184 per 1000 per annum; the theater rate for the same month was 233 per 1000 per annum. Many factors were responsible for the tremendous increase in venereal disease. The loss of key personnel and seasoned troops thru redeployment and transfers led to a lowering of unit standards of discipline and morale. The assignment to the theater of young and relatively unseasoned troops without adequate knowledge or training in venereal disease prevention and the prevalence of disease in the civilian population were important contributing causes.

ANALYSIS OF VENEREAL DISEASE RATES AND TRENDS: A graphic picture of the incidence of venereal disease in the Third United States Army including a comparison with theater rates and a breakdown into white and colored rates may be obtained by a study of annexes. It must be pointed out that Weekly Statistical Health Reports do not give a true picture of the incidence of venereal disease in the Army. The reason for this is that these reports are submitted by Third Army dispensaries and may include cases from other than Third United States Army; likewise many cases from Third Army are hospitalized in Continental Base Reception hospitals and are reported by those units. Since 15 November the

only Third United States Army unit reporting syphilis is the Sonthofen Station Complement Unit Dispensary. The marked reduction in rates during the months of March and November are due in part to the turn-over by Third Army of hospitals under its control.

A monthly venereal disease statistical report is submitted thru command channels for each unit in Third United States Army. These reports give an accurate monthly rate for venereal disease in all major subordinate commands and by consolidation the total rate for Third Army is obtained each month. Monthly venereal disease statistical reports for the year are appended to this history (See Annexes to).

An analysis of the figures shows that venereal disease rates for the entire year have been consistently lower than rates for the theater as a whole; however the trends have paralleled those of the theater. The peak incidence was reached during the midsummer months of July and August. A slow but definite downward trend has been evident during the last five months of the year. In general, rates for colored troops have been at least three times as high as those for white troops and frequently much higher.

A study of venereal disease contacts by cities, showed that with the exception of Paris, France, certain large German cities were the main sources of infection (See Annex #). The following table gives a summary of important cities and changes that occurred monthly. The most noticeable change was the sharp drop in the number of contacts reported from Paris after the removal of large numbers of troops from that city. Almost without exception the German cities high on the list were areas of high troop concentration. The frequent movement of troops also contributed to the rise in Venereal Disease rates.

Month	5 cities with greatest numbers of contacts				
	1	2	3	4	5
February	Nurnberg	Paris	Munich	Bamberg	Augsburg
April	Nurnberg	Bamberg	Mannheim	Heidelberg	Paris
May	Nurnberg	Bamberg	Heidelberg	Mannheim	Furth
June	Bamberg	Nurnberg	Munich	Heidelberg	Mannheim
July	Nurnberg	Munich	Augsburg	Goppingen	Bamberg
August	Auerbach	Augsburg	Munich	Nurnberg	Heidelberg
September	Auerbach	Munich	Augsburg	Heidelberg	Nurnberg
October	Munich	Heidelberg	Augsburg	Regensburg	Auerbach
November	Augsburg	Munich	Heidelberg	Nurnberg	Stuttgart.
December	Munich	Stuttgart	Nurnberg	Augsburg	Heidelberg

CONTROL MEASURES: When Third United States Army Headquarters moved from Bad Tolz to Heidelberg in March, 1946 the increasing need for a vigorous venereal disease control program became apparent. Circular 43, Headquarters Third United States Army, outlined an intensive control program to include the organization of venereal disease control teams in all units and the establishment of a quarantine period of at least 21 days for cases of venereal disease treated on a duty status. This was followed by Circular 59, Headquarters Third United States Army, which outlined in detail the necessary follow-up procedures for the proper medical management of treated cases of venereal disease.

With the onset of spring and warmer weather the venereal disease rate began a steady rise until a peak of 228 per 1000 per annum was reached for the month of July. Early in May 1946 venereal disease control boards were established in the Third United States Army and major subordinate commands as directed by Headquarters, United States Forces European Theater. In September, control boards were instituted in all Third Army units down to battalion and squadron level. The appointment of these boards proved to be one of the most important steps taken in the control of venereal disease during the entire year. Boards were composed of the following: Chief of Staff, G-1 or S-1, the Provost Marshal, the Surgeon, the Special Service Officer, and the Chaplain (See Annex #). The following duties and responsibilities were delegated to venereal disease control boards:

Survey conditions affecting the venereal disease rates and keep informed at all times of the venereal disease situation within the command. Make recommendations and take action for the correction of unfavorable conditions.

Insure follow-up action on corrective measures.

Meet at regular intervals to consider current problems, initiate new measures and provide for effective follow-up action.

The venereal disease control program was given further emphasis by a letter from this headquarters in May. The importance of command responsibility and the moral aspects of venereal disease were re-stressed. Unit commanders were directed to designate "Venereal Disease non-commissioned officers" for each twenty (20) enlisted men to act as assistants to the unit surgeon in matters pertaining to venereal disease control. The most important duty of the "Venereal Disease non-com" was to aid the infected soldier in finding the contact and seeing that she was sent to a civilian hospital for examination and treatment.

Another step in venereal disease control was taken in early May with the assignment of two Prophylactic Platoons to Third United States Army. Each platoon consisted of a headquarters and four (4) detachments of six (6) men each. These platoons operated prophylactic stations in military communities not serviced adequately by other medical units. Each detachment operated one (1) prophylactic station. On 15 August 1946, the 514th and 515th Prophylactic Platoons were attached to the United States Constabulary and made operational with detachments in Munich, Stuttgart, Kitzingen, and Bayreuth. On 1 September the 516th Prophylactic Platoon was attached to the United States Constabulary and made operational with detachments in Wiesbaden, Kassel, Wetzlar, and Karlsruhe. These units were deactivated on 30 November 1946 and the prophylactic stations were turned over for operation to medical units in the area.

During the late spring, concern was felt by some subordinate units over an apparent shortage of prophylactic items, particularly mechanical prophylactics. A survey of representative units showed that in most instances the shortage was due to failure of units to requisition those items thru proper channels in the proper amounts. A strong effort was made to control waste and the diversion of prophylactics to black market channels. The basic issue of mechanical prophylactics was increased from

4 to 6 per man per month by the authority of United States Forces European Theater Circular 92, Circular 102, Headquarters Third United States Army, made it possible for units to draw any reasonable amount of prophylactic items over and above the established basis of issue upon the written statement of a medical officer that the increase was necessary for proper venereal disease control in the unit concerned (See Annex #). These circulars effectively remedied the problem of shortages for the remainder of the year.

THE CIVILIAN PROBLEM: The major source of venereal disease among the occupation forces was the infected civilian population. The tremendous moral, social and economic upheaval in Germany resulting from total defeat provided fertile soil for the spread of venereal disease. The problem was complicated further by shortages of medical supplies and personnel in many civilian venereal disease hospitals. The role of the German male in the spread of these diseases was another factor that was often overlooked. Obviously venereal disease could not be diminished among Army troops without vigorous measures to control and treat infected civilians.

A venereal disease conference attended by representatives from Third United States Army and Military Government was held in Heidelberg, Germany on 26 April, 1946. The main topics discussed were the examination and treatment of contacts, the suppression of prostitution and the proper conduct of vice raids. A station list of troop locations was furnished to Military Government so that venereal disease hospitals could be set up near areas of troop concentration. Another venereal disease conference was held at Hammersbach, Bavaria on 17 and 18 June 1946. At this meeting initial action was taken to establish minimum requirements for the proper examination and treatment of venereal disease contacts and suspects which were later put into effect.

An important step in the coordination of the activities of Military Government, troop units, and civilian venereal disease agencies was taken in October 1946 with the assignment of a liaison officer from Third United States Army to the Office of Military Government for Bavaria. In November, two additional liaison officers were assigned to the Laender Wurttemberg-Baden and Greater Hesse and a Standard Operating Procedure was published outlining the duties and responsibilities of these officers (See Annex #). These liaison officers attended the monthly meetings of the Third United States Army Venereal Disease Control Board to report on their activities.

In spite of numerous difficulties and deficiencies in the control of venereal disease among civilians, much progress and improvement was made during 1946. An educational and publicity program was instituted for the benefit of civilians including lectures, posters and venereal disease films. A limited supply of prophylactic items was manufactured and made available to the civilian market during the year. The most important single advance in treatment was the provision of penicillin for the treatment of gonorrhoea. Figures from the city of Munich showed that 85-90 % of gonorrhoea

cases were cured after the first course of penicillin. No penicillin was available for the treatment of syphilis. A serious shortage of penicillin

developed during October and November; however the situation was relieved at the close of the year by War Department release of additional stocks for German civilian use.

A station list of venereal disease examining and treatment centers compiled at the close of the year listed a total of 138 separate centers in all parts of the US Zone of Germany (See Annex #). The locations of venereal disease hospitals are graphically shown on the enclosed map (See Annex #).

EDUCATION AND PUBLICITY: Educational and publicity measures have been utilized by the Army in the control of venereal disease for many years. During 1946 most of the usual educational measures were in effect including lectures, posters and newspaper articles; in addition to these, many new measures were introduced.

On 1 September 1946 a theater-wide educational and publicity campaign was begun as outlined in letter, Headquarters, United States Forces, European Theater, AG 726 GAF-AGC, subject: "Venereal Disease Control", dated 22 August 1946. Radio publicity and slogans were used extensively for the first time. The Third United States Army indorsement to the above letter, dated 29 August 1946, directed all units to conduct a comprehensive six hour program of venereal disease instruction during the month of September and presented suggestions to accomplish this. The following subjects were given special emphasis:

- The prevalence of venereal disease among the local population.
- The serious nature of the venereal disease problem to the Army and to the individual.
- The devastating effects of venereal disease on the body and the frequent failures of penicillin in treatment.
- The moral and social significance of sexual promiscuity.
- The detailed use of individual prophylactic measures.
- The importance of reporting infected contacts to insure their treatment.

The educational program was implemented by the preparation of an actual training schedule with references, to be used by small, separate Army units. The schedule consisted of short talks supplemented by demonstrations, group discussions, and appropriate films. The services of the unit commander, the medical officer and the chaplain were freely used in presenting these talks.

Posters were an important part of the campaign against venereal disease. Many new posters appeared during the year; these included: "Loyal", "For Your Own Good", "Keystone", "Control", "How to Give a Prophylaxis" and "Ten Minutes with Venus". Copies of all of these posters are appended (See Annexes # to). In addition Third Army and Theater public relations offices also coordinated efforts to produce many other new posters. An effort was made to display posters only in appropriate places in accord with good taste.

The venereal lectures presented during the basic officer's course at the Third Army School Center, Seckenheim, Germany were very instructive and well received by the students. The lecture consisted of a discussion of the "Anatomy of Venereal Disease" illustrated by diagrams and actual

pathological specimens. A letter was published in November 1946 directing that officers completing a course at the School Center be required to give lectures to the men of their respective units based on the material presented at the school. By the close of the year a plan was under consideration to require student non-commissioned officers also to present lectures on return to their units based on the outline presented at the school.

More graphic presentation of the dangers of venereal disease was accomplished in many units by the demonstration of actual clinical cases or by the use of pictures of cases. The booklet, "This War is Never Won", published by the United States Constabulary and the 1st Infantry Division, contained many excellent pictures of this type and was widely distributed. Training films on venereal disease were shown to troops including "Sex Hygiene", "The Story of DE-733", and "Early Diagnosis of Syphilis".

Serious consideration was given to the problem of venereal disease occurring among replacements arriving from the states. In many cases orientation of the soldier on venereal disease prior to coming overseas was deficient or totally lacking. In order to remedy the situation, venereal disease orientation lectures were instituted for all troops passing thru the Third Replacement Depot at Marburg, Germany.

Civilian venereal disease education continued to be a problem but considerable progress was made. Several units started a program of voluntary lectures for civilian employees. With the cooperation of German doctors and city officials, such lectures were a valuable means of informing the civilian population about the dangers of venereal disease. Objections of the clergy to venereal disease education were minimal.

Another method of combating venereal disease was the provision of more and better recreational and amusement facilities for the troops. Unit athletic officers and special service officers played an important part in accomplishing this. Hobby shops, camera clubs, movies, and libraries were valuable diversions. The system of Information and Education schools also served the same purpose.

It is believed that too much emphasis was placed on the establishment of unit clubs since most of these were places of excessive drinking. Liquor is considered a very important contributing factor in the incidence of venereal disease. Surveys from 302 forms (Individual Report of a Case of Venereal Disease) indicate that forty per cent of infected soldiers admit intoxication or moderate drinking at the time of contact. Reports from subordinate venereal disease control boards indict liquor as a contributing factor in an even higher percentage of cases.

Responsible soldiers are delegated to duty in bars and clubs to prevent excessive drinking. Many units limit the sale of liquor to a designated number of drinks. Emphasis has been placed on the provision of recreational facilities other than bars and clubs. Recommendations have been made to higher headquarters to establish a theater policy forbidding the sale of liquor on Sundays. Snack bars where no liquor is sold have been established in all communities. In addition forced chemical prophylaxis of men returning from pass intoxicated is practiced.

ENVIRONMENTAL SANITATION

After taking over the area of Seventh United States Army on 1 April, Third United States Army occupied the entire U.S. Zone of Germany with the exception of the Berlin and Bremen Enclaves. The topography of this area varied from plains and lowlands to mountainous areas. Drainage for the area was adequate.

The weather throughout the year was temperate. There were no marked extremes of temperature though the cold wave in December evoked hardships, particularly on the civilian population, due to the coal shortage and paralysis of river transportation. Rainfall was considerable in Bavaria and fog was frequent throughout the area.

WATER SUPPLY: With the occupational forces on more of a peace time basis, emphasis was placed on improving municipal supplies to the point where they could be approved for drinking and culinary purposes, particularly those cities where Military Communities were located. Until the municipal supply is suitable for approval under the standards established by Theater water is provided by Army water points and the individual use of water purification tablets.

All Major Third Army Communities and practically all these smaller ones have been surveyed to determine the repairs and equipment necessary before the supply or supplies can be approved.

Supplies are approved only after a physical survey to determine a protected and sufficient source, adequate pumping, storage, and distribution facilities, adequate treatment, competent personnel for operating, and consistent chlorination in amounts to conform to Theater standards. At the end of the year four (4) supplies of Third United States Army Communities were approved; they were Darmstadt, Seckenheim, Heidelberg and Augsburg. Approval is pending on several other supplies. Delays in approval of supplies were due to supply and technical difficulties in the repair of damaged systems and procurement and installation of chlorinators.

Water supplies were surveyed by the Sanitary Engineer from this office or the Sanitary Engineer for the United States Constabulary. Upon the completion of each survey a report was written and furnished the Army Engineer, giving all available data concerning the system. A chlorination report was furnished the Theater Chief Surgeon's Office, listing equipment available and that necessary before the supply might be approved. A command letter was sent to each Military Community Commander listing the changes necessary for approval and advising him of the procedure necessary to obtain equipment; he was also advised to request a resurvey when the supply was ready for approval.

The direct supervision of the municipal supplies was the responsibility of the local Military Government Detachment; any operational changes were cleared through Military Government. Supervision of the potability of the water was the responsibility of the Community Surgeon. Cooperation was excellent in the achievement of coordinated supervision.

The following cities were surveyed and the required equipment allocated:

Bamberg	Fussen
Coburg	Sonthofen
Bayreuth	Stuttgart

Kassel	Weiden
Rothwestern	Wetzlar
Kitzingen	Amberg
Munich	Grafenwohr
Degerndorf	Landshut
Freising	Ravensburg
Heidenheim	Kaufbeuren
Russelsheim	Bad Tolz
Fulda	Bad Aibling
Hersfeld	Goppingen
Murnau	Weinheim
Kempten	Ober Ramstadt
Oberammergau	Tegernsee
Berchtesgaden	Garmisch

The following cities were surveyed but equipment was not available for allocation:

Hof	Esslingen
Eschwege	Ulm
Pfaffenhofen	Zwingenberg
Ludwigsburg	Altenstadt
Karlsruhe	Mosbach
Hall	Schwabach
Boblingen	Weilburg
Kulmbach.	

Most of these surveyed supplies had little or no treatment originally. Where there was a poor bacteriological history, approval was withheld until it was demonstrated that the supply was presently potable.

A command letter, AG 720, GNMCM-3, dated 19 December 1946, subject: "Collection of Water Samples in Military Communities and Satellites" was published (See Annex #). Material was published in a Third United States Army Circular Number 163 dated 27 December 1946 concerning water discipline (See Annex #).

WASTE DISPOSAL: Human waste disposal was generally accomplished by means of water-borne disposal systems. Some units on field problems used field methods of disposal. As the Kasernes became repaired there were few complaints concerning toilet facilities.

The troops were instructed not to consume fresh vegetables from civilian sources due to the practice of using human waste as fertilizer. Mikrokylene rinse was available for use by all messes and dependents kitchens.

Garbage was disposed of by incineration or removed by civilian collectors. There were no major problems connected with garbage disposal.

INSECT CONTROL: There were no major problems of insect control during the period. Flies were abundant during the summer and fall months. Lack of screening material was temporarily alleviated by use of cloth screening. It is recommended that metal screening material be made available for at least kitchens, mess halls, and latrines before next summer.

Bedbug infestations were occasionally noted in troop billets. Adequate control was accomplished with 5 % DDT spray and DDT louse powder. No complaints of bedbug infestations have been reported during the last quarter of the period.

MESS SANITATION: The policies of this section in regard to mess sanitation were published in Administrative Instructions # 5, this headquarters, for the guidance of all units.

Inspections of units made throughout the year revealed marked improvement in mess sanitation. The principal problem during the year was education of the indigenous civilian foodhandlers and dishwashers in Third United States Army messes, snack bars, clubs, and commissaries as to Army standards of sanitation. Attendance at the following schools greatly contributed to the improvements of mess sanitation and mess management during the period:

Third United States Army Cooks and Bakers School,	Seckenheim, Germany
Theater Cooks School	Darmstadt, Germany
Theater Bakers School	Darmstadt, Germany
Theater German Cooks School	Darmstadt, Germany
Theater German Bakers' School	Darmstadt, Germany
Food Conservation and Mess Management School for Officers	Darmstadt, Germany.

FOODS AND NUTRITION

Rations in general proved satisfactory for military personnel. Supplies of fresh vegetables, fruits and meats were short at various intervals throughout the period; however nutritionally adequate substitutes were obtained. A type "A" ration was available to all troops.

The caloric contents of the rations issued were as follows:

Field Ration Type "A"	3898	calories
Hospital "A" Supplement	990	"
Operational Rations	variable	
Continental Allied Ration	3003	"
Displaced Person Hospital Ration	3200	"
Prisoner of War Ration working	2895	"
non-working	2006	"
POW Hospital Supplement	1098	"
Civilian Internee Ration working	2400	"
non-working	1700	"
Civilian Internee Hospital Supplement		
	"A"	340 "
	"B"	656 "

PRISONER OF WAR CAMPS AND HOSPITALS

At the beginning of the period there were nearly 205,000 Prisoners of War held by Third United States Army. There were no outbreaks of

disease and sanitary facilities were adequate; however overcrowding existed. During the period the discharge of Prisoners of War was accelerated, alleviating overcrowding and concentrating the remaining Prisoners of War in four (4) camps. At the end of the period there were only 15,000 Prisoners of War held in Third United States Army enclosures. Likewise the number of Prisoners of War hospitals was reduced from one-hundred (100) to six (6).

Immunizations of Prisoners of War were completed. Sanitary facilities were improved during the period. Only one camp, Heilbronn, Germany (PWE # 10) still remains of semi-permanent structure; the walls and floors of the huts are wooden but the roofs are tentage.

Nutrition of the Prisoners of War has been adequate throughout the period.

CIVILIAN INTERNEE CAMPS AND HOSPITALS

Prisoners in the Internee Camps included war criminals, automatically arrested Nazi officials, discharged members of the armed forces held for war crimes, and other civilians held for investigation or trial. The age groups in Internee Camps were higher than in Prisoner of War camps and considerable numbers of elderly persons were held.

Internee camps were generally permanent installations and well equipped because internees were to be held for an indefinite period; however there was overcrowding evident in most camps. At the beginning of the period there were twenty-one Civilian Internee camps with 82,308 internees. At this time there were only three (3) designated Civilian Internee hospitals and many internees were hospitalized in Prisoner of War hospitals. Due to the increasing Civilian Internee population and rapidly diminishing Prisoner of War population, fourteen (14) Civilian Internee hospitals were in operation by August. Near the end of the period plans were completed for transferring many of the internees and camps to German control under the supervision of Military Government. At the end of the period there were only four (4) camps and 20,359 internees under Third United States Army control. This turnover somewhat relieved the overcrowding.

The general physical condition of the internees was not good, particularly among the war criminal group; however there were no serious outbreaks of disease. Immunizations were maintained currently. The nutritional status of the Civilian Internees was unsatisfactory during the period. The 1700 calorie non-workers' ration was considered inadequate for maintenance of weight and health. In March Headquarters, United States Forces European Theater, authorized only 15 percent of the internees to receive the workers' supplement of 700 calories. In most cases more than 15 percent of the internees were engaged in some type of labor. Inspections and reports revealed that weight loss was occurring among the internees and appropriate recommendations were made. In November Headquarters, United States Forces, European Theater authorized 50 % of the internees to receive the workers diet supplement.

Malnutrition was serious among the internees in Civilian Internees

Enclosure # 91, Darmstadt, Germany. Hospitalization of the seriously malnourished, and the increased percentage of workers' rations improved the situation.

In Dachau, Germany, the War Criminal inmates reached a serious state of malnutrition. The increased allowance of workers' ration supplements did not aid this group because, for security reasons, they were not allowed to go on work details outside the enclosure. A provisional hospital was established in the enclosure to authorize the most severely malnourished cases the hospital ration supplement. In addition appropriate recommendations were made to Headquarters, United States Forces, European Theater. At the end of the year a temporary expedient was authorized to allow all war criminals a 2000 calorie diet and to feed all malnutrition and borderline malnutrition cases the hospital supplement.

The hospital ration as prescribed in Letter, Headquarters, United States Forces, European Theater, AG 430.2 GFC-100, subject: "Hospital Ration for Civilian Internees under Direct Control of U.S. Forces", dated 6 November 1945 was considered deficient in certain items necessary for a hospital diet. Certain recommendations including the following were made:

Meat allowance should be increased from 60 gms. to 80 gms. for rehabilitation of cases of malnutrition, tuberculosis, and other debilitating diseases.

Vegetables should be substituted for other items now issued to provide items which can be used in the preparation of special diets such as the diabetic diets.

Fats should be increased to allow for the preparation of foods by other than boiling.

At the end of the year these recommendations were still being studied by Headquarters, United States Forces, European Theater.

It is estimated that it will take many months of feeding the hospital diet to the malnourished war criminal group for rehabilitation. It is recommended that permanent increase in the basic ration scale to 2000 or more calories be authorized.

DISPLACED PERSONS CAMPS AND HOSPITALS

The general health of the Displaced Persons has been good during the period.

There has been an increase in the Displaced Person population during the year; in addition there has been a great turnover of the population, including many planned mass movements into and out of Germany. On 1 January there were 320,673 displaced persons located in 294 camps in the U.S. Zone of Germany; of these there were approximately 25,000 Jewish displaced persons. By August the population had swelled to 410,000. Repatriations, immigrations, and screening of the population reduced the figure to 379,564 by the end of the year; of these approximately 125,000 were Jewish displaced persons. Though these many movements occurred under adverse conditions frequently, there were no severe outbreaks of communicable disease. There are now 376 displaced persons camps, 85 % of which have excellent sanitary facilities. Improvements have been made in all camps during the period.

IMMUNIZATIONS: Diphtheria immunization of children up to the age of sixteen is 75 percent complete. Typhus immunization of all displaced persons is 82 % complete. Smallpox vaccination is 76 percent and typhoid immunization 80 % complete. These figures are obtained from records on hand and it is believed that higher percentages have been completed and individual records lost during movement between camps.

COMMUNICABLE DISEASE: The rate for diphtheria is lower than the German civilian rate. Only one mild outbreak occurred during the period. There were seven cases with one death reported from a childrens' center, Kloster Indersdorf. Investigation revealed two infiltrees from Poland were carriers.

There has only been one confirmed case of typhus among displaced persons; this occurred in a refugee coming from Poland.

A few sporadic cases of typhoid have occurred but control measures prevented any outbreaks of this disease.

It is estimated that the tuberculosis incidence among displaced persons is one percent. Surveys by the Don-Swiss X-Ray teams using 35 mm film are about 50 percent complete. There are approximately 1500 cases of active tuberculosis hospitalized.

Veneral disease among displaced persons is treated in the civilian veneral disease treatment centers. The highest rate during the period was recorded during August, 20.3 per thousand per annum. The rate for the year was 17 per thousand per annum. Similar to the statistics previously reported for United States personnel and German civilians, the syphilis-gonorrhea ratio has increased among displaced persons during the period. Veneral disease education has been made a program in most camps.

Scabies is prevalent among displaced persons. The rate tends to be low in camps with adequate sanitary facilities and extremely high in those camps that are inadequate. The rate reached a peak in September of 75 per thousand per annum. At that time benzyl benzoate emulsion from Army stocks was made available. Since then there has been a steady drop in the rate to 41 per 1000 per annum for December. Continued improvement of sanitary facilities will further diminish this rate.

In August there was an outbreak of summer diarrhea among infants in the camp at Altenstadt; there were twenty-seven cases with seven deaths. Investigation revealed poor sanitary facilities in the camp; the children had been improperly fed and most of them were markedly dehydrated upon admission. An emergency kitchen was set up for the children; a special team was used to clean up the camp and supervise infant feeding.

In September there were 8 cases of poliomyelitis reported from Stuttgart. The disease was mild; no deaths or residual paralyses occurred.

In December there was an outbreak of an enteric disease among children in the camp at Wildflecken (population 40,000). The disease began with enteric symptoms and then manifested signs of meningeal irritation. There were 70 cases reported with 26 deaths. Autopsies revealed cerebral edema but no meningitis. Strict isolation was put into effect and no cases have since occurred.

... rate for displaced persons reached 51 per thousand per annum. The death rate was 4.2 per thousand per annum. The neonatal death rate was 51 per thousand births; infant mortality rate was 73 per thousand births.

Nutrition among displaced persons was adequate during the period. The ration scale as outlined in Letter, Headquarters, United States Forces, European Theater, AG 383.7 GFC-AGO, subject: "Care and Feeding in Approved Assembly Centers, of United Nations Displaced Persons, Persecutees and Those Assimilated to them in Status", dated 11 October, 1946, is considered nutritionally adequate though the low allowances of fat, sugar, and protein diminish its palatability.

Many improvements were made during the year. The health of the displaced persons remains good. There were no adverse conditions reported during the year upon which corrective action has not been initiated.

REPORTS AND RECORDS

During the period this sub-section was responsible for the review, consolidation and/or forwarding of the monthly sanitary reports, special sanitary reports, sick and wounded reports, reports of communicable disease, statistical health reports, individual reports of venereal disease, and other special reports. In many instances action was taken to assist units in correcting deficiencies reported and to accomplish measures recommended by the unit surgeons.

The following number of reports were received and reviewed by this headquarters:

Monthly Venereal Disease Reports	658
Individual Report of Case of Venereal Disease (USPET MD Form 302)	21,666
Emergency Medical Tags	49,928
Sick and Wounded Reports	1,264
Monthly Sanitary Reports	856
Weekly Statistical Health Reports	2,356
Line of Duty Investigations	2,352
Miscellaneous Reports	4,061

SUMMARY

During the period the health of the command remained excellent. The principal problems encountered were control of venereal disease, scabies and diphtheria and provision of an adequate diet for civilian internees.

A constant program of venereal disease control brought about a gradual reduction in the venereal disease rate in the last half of the period.

Educational measures, frequent inspections, provision of adequate therapy of scabies has brought about a reduction in the hospitalized rate of this infestation.

Diphtheria was the most prevalent of the serious respiratory diseases encountered during the period. Small outbreaks occurred in numerous units; these outbreaks were immediately investigated and control measures put into effect. The diphtheria immunization, begun late in the period, is expected to be 100 % complete by February 1947.

Nutrition among the Civilian Internees under United States control was poor. Recommendations for increases in the ration scale were made to Theater. A temporary increase in rations for War Criminal internees was granted at the end of the period. The increase in the percentage of internees authorized workers ration was an expedient which provided a general increase in the ration for other internees but did not entirely solve the problem.

RECOMMENDATIONS

Continued close liaison with Military Government and civilian public health offices.

Early but careful approval of water supplies in military communities.

Provision of adequate screening for troop messes, messhalls, and latrines.

Continued inspections of all units to insure the adequacy of sanitary facilities.

Fulfillment of minimal dietary requirements for Civilian Internees and approval of the recommended changes in the Civilian Internee hospital ration.

That a quarantine for communicable disease, including venereal disease, be instituted for all new troops arriving in the theater or transferred into the U.S. Zone of Germany.

That a theater policy on restriction of liquor sale be made as a venereal disease control measure.

That the program for the elimination of undesirable personnel including venereal disease repeaters be continued at all levels.

That all possible measures be taken to continue to supply Military Government with drugs for the treatment of venereal disease among civilians.

That mandatory venereal disease lectures be instituted for all male and female indigenous employees of the United States Forces.

That the increase in the incidence of syphilis be studied by higher headquarters.

Limitations Upon Punishment By Courts-Martial.....I
Skin Diseases.....II
Report of Officer Personnel Returning To The ZI For Reassignment.....III

I - LIMITATIONS UPON PUNISHMENT BY COURTS-MARTIAL

1. Radiogram WCL-43745, War Department, dated 13 September 1946, is quoted as follows:

"For information of all concerned, Executive Order 9772 signed 24 August 1946 by President terminates, as to offenses committed in occupied enemy territory after 24 August 1946, the suspensions of limitations upon punishments for violations of Articles of War 58, 59, 61 and 86, provided by Executive Order 9048, 3 February 1942 and Executive Order 9267, 9 November 1942. Executive Order 9772 provides that punishments for violations of these Articles of War as to offenses committed occupied enemy territory after 24 August 1946, shall be subject to limitations prescribed by table maximum punishments, paragraph 104 (c) for Manual for Courts Martial 1928."

2. The contents of this section will be brought to the attention of all summary, special, and general court-martial personnel immediately upon receipt and an extract copy thereof posted in each copy of Manual for Courts-Martial, 1928 (corrected to April 20, 1943.)

3. All cases wherein sentences in excess of the Table of Maximum Punishment have been assessed for such offenses committed subsequent to 24 August 1946 will be reviewed immediately and the excessive part of the sentence remitted.

4. Authority: Messageform, file AG 250.1 (Enl) AGE-4, Headquarters United States Forces, European Theater, dated 16 September 1946. JA

II - SKIN DISEASES

1. The attention of all medical officers and unit commanders is directed to their responsibilities in the matter of hygiene, sanitation, and the prevention of communicable diseases as stated in Army Regulations 40-205 and Army Regulations 40-210. The rising incidence of skin diseases, particularly scabies, among troops calls for immediate emphasis being placed on control measures for these diseases.

a. Scabies:

- (1) Medical officers will give particular attention in monthly and special physical examinations to personal hygiene among troops. They will familiarize themselves with living conditions, bathing and other sanitary facilities available and will make appropriate recommendations to their commanding officers for correction of defects.

(over)

Cir 123, Hq Third US Army
dtd 23 Sep 1946, cont'd

- (2) Venereal disease and scabies frequently occur concomitantly due to the fact that both have the common factor of close body contact.
- (3) Reinfection of patients and infection of close associates may occur over a period of ten (10) to fourteen (14) days from infested clothing or bedding. It is therefore essential that the personal effects, including sheets and blankets, or patients suffering from scabies be disinfected. Ordinary good laundering and dry cleaning will accomplish the desired result. Dusting or spraying with DDT preparations is not considered effective.
- (4) Early diagnosis, adequate therapy, and proper disinfection of personal effects will prevent unnecessary hospitalization and reduce the non-effective rate of the command.

b. Sycosis Barbae ("Barbers Itch")

- (1) A number of cases of sycosis barbae have been reported among Third United States Army troops. Inspections of barber shops serving military personnel reveal that proper sanitary measures are not being provided.
- (2) The attention of all unit commanders is directed to the provisions of paragraph 9, Army Regulations 40-205, "Barbers and Barber Shops". Particular emphasis should be placed on the following:
 - (a) All brushes, combs, razors, clippers, scissors, tweezers, massage and scalp applicators, etc. will be thoroughly cleansed and sterilized (preferably in 5% lysol for 3 minutes) after each separate use thereof.
 - (b) A freshly laundered towel will be used for each patron.
 - (c) The use of powder puffs, neck dusters, sponges, and styptic pencils is prohibited. MED

III - REPORT OF OFFICER PERSONNEL RETURNING TO THE ZI FOR REASSIGNMENT

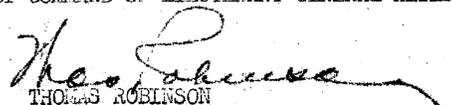

Section II, Circular 107, this headquarters, dated 12 August 1946, subject as above, is amended by adding sub-paragraph 3d:

"d. Negative reports are desired."

Scabies I
Enlisted Personnel as Guests in Officer's Messes II

I - SCABIES

1. Scabies, more commonly known as "the seven-year itch", is a disease of filth. It is caused by a tiny mite that burrows into the skin and causes intense itching which is accentuated at night. The lesions on the skin are small crusty pimples that are connected with a barely visible dark furrow. They may be localized to the pubic or genital area in mild or early cases but may extend to all parts of the body, most characteristically on the upper thighs and buttocks, lower abdomen, arm pits, fingers, wrists and forearms. Scabies infestation is acquired by contact with infested persons or clothing and bedding used by infested individuals. The disease can be cured in a short time by the use of benzyl benzoate emulsion or sulfur ointment plus rigid control of personal hygiene; the treatment must be given by a medical officer. Prevention of the infestation is even more important. The mite or its eggs may linger in clothing or bedding for weeks. Good laundering and dry cleaning will disinfect blankets and clothing. If, for any reason, these methods cannot be carried out immediately, disinfestation should be accomplished by the use of methyl bromide or steam. DDT is not effective for this purpose. Frequent bathing of all troops and maintenance of the highest standards of personal hygiene are imperative for the control of this infestation. The incidence of scabies is a yardstick of the personal hygiene in a command.

2. The rate for scabies among Third United States Army Troops for November was 54.4 per 1000 per annum. This rate is 22 per 1000 per annum higher than the rate for October and is higher than the rate for the total theater. This figure represents only those cases of scabies treated in hospitals and quarters and there is ample reason to believe that the duty status rates are from eight (8) to fifteen (15) times the hospitalized incidence.

3. Results of the Army-wide inspection made from 4-22 November 1946, indicate that 11% of the units inspected had inadequate laundry facilities and 15% had inadequate hot water.

4. Improperly conducted monthly physical inspections and inadequate or unused sanitary facilities partially account for the high incidence of this infestation. Commanders and unit medical officers will pay strict attention to principles of troop personal hygiene, early detection of cases, and proper, prompt treatment of patients and known contacts.

5. Commanding officers will insure that living conditions, bathing, laundry, dry cleaning and other sanitary facilities are adequate for all troops under their command.

(Over)

Surgeons will necessarily check all men in the course of the monthly physical inspection which will be conducted. If troops are completely disrobed, a statement will be included in the monthly section of the December 1946, monthly sanitary report (DAGO Form 140) as to the number of men, including hospitalized cases, who are infested with scabies. Comment will be made as to control measures instituted.

7. Your attention is directed to Section II, Circular Number 123, this headquarters, dated 23 September 1946, and paragraph 13 b, Section X, Circular Letter Number 38, Headquarters U. S. Forces, European Theater, Office of the Theater Chief Surgeon, dated 1 August 1946, relative to this disease.

Release from active Duty III

I - TYPHUS REIMMUNIZATION DISCONTINUED

1. Pending revision of Circular 141, Headquarters, United States Forces, European Theater, dated 13 October 1945, typhus reimmunization has been discontinued except as follows:

- a. Personnel employed in reception stations for displaced persons, returning German prisoners of war, and expellees.
- b. Personnel employed at border typhus control dusting stations.
- c. Personnel traveling to destinations on the main European continent east of 18° east longitude (line through Wajharowo, Bydgoszcz, Kalisz in Poland; Oppeln, Germany; Mahr Ostrau, Irencin, Nitra in Czechoslovakia; Gata, Mor, and Pecs in Hungary).

2. The discontinuance of typhus reimmunization is not to be construed as modifying present War Department requirement of typhus fever immunization for travel into this theater. SURG

II - APPLICATIONS FOR COMMISSION IN THE REGULAR ARMY

The following instructions are effective until 31 December 1946 unless rescinded or superseded sooner:

1. The following information pertaining to the submission of applications for commission in the Regular Army under Public Law 670--79th Congress, 8 August, 1946 (Section II, Bulletin 25, War Department, 1946) and Circular 289, War Department, 1946, is published for the information and guidance of all concerned:

a. FORMAL APPLICATION

Application forms (War Department AGO Form 62, 1 September 1946) will be submitted in triplicate by new applicants and by prior applicants physically disqualified or statutorily ineligible at time of prior application, but who are now eligible (see paragraph 1 d and e of above mentioned War Department Circular).

b. SUPPLEMENTARY APPLICATION

Supplementary information forms (War Department AGO Form 62, 1 September 1946, (Green)) will be submitted in two copies by previous applicants who have been notified by The Adjutant General that they will be given further consideration for appointment in the Regular Army.

(over)

Cir 146, Hq, Third US Army
dated 2 November 1946, Cont'd.

2. The applicant's immediate commanding officer will complete the 1st indorsement on the application, secure and attach two certified copies of the individual's qualification card (Form 66-1, 66-2, or 66-3), and prepare and attach one copy of the Officer Evaluation Report (War Department AGO PRT-461). In connection with the preparation of the Officer Evaluation Report, attention is invited to Section II, Bulletin 215, this headquarters, dated 21 October, 1946, which sets forth certain changes to be made in the Officer Evaluation Report Booklet (War Department AGO PRT-462).

3. Completed papers will be forwarded by the applicant's immediate commanding officer directly to Commanding General, United States Forces, European Theater (Attention: AG-Military Personnel Branch), APO 757, US Army, and not to this headquarters.

4. Detailed instructions regarding the submission and forwarding of applications, processing of applicants, etc., are contained in Circular 289, War Department, 1946. RA PROC

III - RELEASE FROM ACTIVE DUTY

1. Circular Number 136, this headquarters, dated 15 October 1946, is amended as follows:

- a. Paragraph 2 a (1) is rescinded.
- b. Paragraph 3 d is amended to add:

"(3) My dependents are in this theater, having joined me on _____ date

2. It is pointed out that the above rescission provides for officers with dependents overseas to apply for relief from active duty at any time prior to 1 December 1946, regardless of the date of arrival of dependents in this theater. AG PERS

1. The venereal disease rate for Third United States Army troops for the four week period ending 28 June 1946 was 189 per thousand per annum. The white rate was 174 per thousand per annum and the colored rate was 289 per thousand per annum.
2. The rate of 189 per thousand per annum was slightly higher than the rate for May 1946, which was 179 per thousand per annum. The difference is not great enough to draw any definite conclusions.
3. The US Constabulary showed the largest single increase in rate. The reasons for this are difficult to evaluate at the present time, in view of the fact that the Constabulary has a strong venereal disease control program.
4. No units showed any significant decrease in rate, but slight decreases were noted in the 1st and 3rd Infantry Divisions.

1. The venereal disease rate for Third United States Army troops for the four week period ending 26 July 1946 was 228 per thousand per annum. The white rate was 185 per thousand per annum and the colored rate was 494 per thousand per annum.

2. The rate of 228 per thousand per annum was considerably above the

rates of 189 per thousand per annum for June and 179 per thousand per annum for May. Factors considered as contributory to the increased rate are lower troop strength with no significant change in the number of available contacts, the relative inexperience of new troops, and the difficulty in supervising troops housed in scattered billets.

3. The 1st Infantry Division showed the greatest increase in rate chiefly due to a marked increase in the rate of attached colored troops. The 9th Infantry Division had a considerable increase in rate due to an increase in rates of both organic and attached white troops. An increase was also shown by other Army Troops colored and total other Army Troops.

4. Decreases in rate were shown by the 3rd Infantry Division and the US Constabulary.

Aggregate Third Army	96954	181	1881	5	2067	221.8	1549

1. The venereal disease rate for Third United States Army troops for the five (5) week period ending 30 August 1946 was 222 per 1000 per annum. The white rate was 161 per 1000 per annum and the colored rate was 686 per 1000 per annum.

2. The rate of 222 per 1000 per annum was slightly lower than the rate of 228 per 1000 per annum for July 1946. The rate was maintained at a high level because of the marked increase in cases among colored troops which offset the decrease in rate shown by white troops.

3. An increase in rate was shown by total other Army troops due to a marked increase in the rate of colored troops in other Army units.

4. The 9th Infantry Infantry Division showed the greatest decrease in rate due to the decrease in all components. Decreases were also shown by the U S Constabulary and the 1st Infantry Division.

5. Mean strengths are an average of weekly unit strengths published by this headquarters. These figures are used rather than daily mean strengths as the latter are not available for all Third U S Army units.

1. The venereal disease rate for Third United States Army troops for the four (4) week period ending 27 September 1946 was 108 per 1000 per annum. The white rate was 143 per 1000 per annum and the colored rate was 683 per 1000 per annum.

2. The rate of 108 per 1000 per annum was considerably lower than the rate of 222 per 1000 per annum for August, 1946. The reduction in the rate was due to a decrease in the rate shown by white troops.

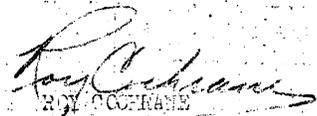

(Over)

3. The Ninth and First Infantry Divisions showed the greatest decrease in rates respectively. Decreases were also shown by other Army troops and the US Constabulary.

4. Increases in rates were shown by the attached white and colored troops of the First Infantry Division, by the attached colored troops of the Ninth Infantry Division and by the attached white troops of the US Constabulary.

5. Mean strengths are an average of weekly unit strengths published by this headquarters. These figures are used rather than daily mean strengths as the latter are not available for all Third US Army units.

1. The venereal disease rate for Third United States Army troops for the four (4) week period ending 25 October 1946 was 105 per 1000 per annum. The white rate was 154 per 1000 per annum and the colored rate was 509 per 1000 per annum.

2. The rate of 105 per 1000 per annum was only slightly lower than the rate of 198 per 1000 per annum for September. The reduction in rate was due to a decrease in rates shown by all colored troops and the US Constabulary.

(Over)

3. District II is reported initially this month; therefore there are no comparative rates available.

4. Decreases in rates were shown by all colored troops, the US Constabulary and the attached white troops of the 9th Infantry Division.

5. Increases in rates were shown by the 1st and 9th Infantry Divisions, other Third U S Army white troops and the attached white troops of the 1st Infantry Division and U S Constabulary.

6. The syphilis-gonorrhea ratio was 1:5.2.

7. Mean strengths are an average of weekly unit strengths published by this headquarters. These figures are used rather than daily mean strengths as the latter are not available for all Third U S Army units.

Aggregate Third Army	65303	175	691	6	872	173.6	2220

1. The venereal disease rate for Third United States Army troops for the four (4) week period ending 27 December 1946 was 174 per 1000 per annum. The white rate was 153 per 1000 per annum and the colored rate was 426 per 1000 per annum.

2. The rate of 174 per 1000 per annum showed a continued decrease over the rate of 189 for the month of November; continues the downward trend since the peak of 228 during July 1946; and is the lowest rate since April 1946. The reduction in rate was largely due to decreases in rates of the 1st Infantry Division, total other Army Troops, and particularly to the general lowering of rates of colored troops.

3. Increases in rate were shown by the 9 Infantry Division and District II Third U S Army area. The total Third Army white rate increased 7.5 over the rate for November.

4. Decreases in rates were shown by the 1st Infantry Division, US Constabulary, and Total Other Army Troops. The total Third Army colored rate decreased 236.5 over the rate for November 1946.

5. The syphilis-gonorrhoea ratio was 1:4. The ratio for November 1:5. This indicates a continued increase in syphilis despite the reduction in the total venereal disease rate and emphasizes the need to stress the prevalence and dangers of this disease to all troops.

6. Districts I and III, Third U S Army area, are reported initially for the period 20 - 27 December 1946.

Individual Report of Case of Venereal Disease..... I
Venereal Disease Control..... II
Supply of War Department and United States Forces, European
Theater Blank Forms..... III
Transportation of Private Automobiles to the European Theater..... IV

I - INDIVIDUAL REPORT OF CASE OF VENEREAL DISEASE (USFET MD Form #302)

1. Attention is directed to paragraph 8a, Circular Number 92, Headquarter United States Forces, European Theater, dated 18 June 1946. This requires that an information copy of Form 302 will be submitted to the Theater Chief Surgeon, APO 757, attached to the Statistical Health Report (WD AGO Form 8-122), for each new case of venereal disease reported.

2. Additional requirements in the preparation of Form 302 are listed below:

a. The required Form 302 will be included even though the complete venereal disease contact history has not been obtained.

b. Section I and Section VIII of the Form 302 will be completed.

c. The name of the major command to which the individual concerned is assigned will be placed in the upper right corner of the report; i.e., United States Forces, European Theater, United States Air Forces, Europe, Third United States Army, Continental Base Section, etc. Each unit rendering the report will have a station list showing all units assigned to its own Major Command. When the report is on an individual assigned to another major command, not known, a negative report will be made, i.e., "not assigned to

Major Command of reporting unit".

3. All units required to submit a Statistical Health Report (WD AGO Form 8-122) will insure compliance with the above directives.

4. Authority: Circular Letter 37, Office of the Theater Chief Surgeon, dated 1 July 1946. Surg

II - VENEREAL DISEASE CONTROL

Venereal Disease Control Board meetings of major subordinate commands, proscribed by Paragraph 8, letter, Headquarters United States Forces, European Theater, file AG 726 GAP-AGO, subject: Control of Venereal Disease, dated 23 April 1946, will be held monthly by the fifteenth day of the month. Minutes of the meetings of these boards will be transmitted to this Headquarters (Attention: Surgeon), so as to arrive by the twentieth day of the month.

Movement and Billeting of Dependents.....
Venereal Disease Control Boards.....

I - MOVEMENT AND BILLETING OF DEPENDENTS

1. References:

- a. Section III, Bulletin Number 67, this headquarters, dated 13 April 1946.
- b. Section V, Circular Number 73, this headquarters, dated 18 May 1946.
- c. Letter, file AG 230 AGP, Headquarters, United States Forces, European Theater, subject: "Action to Prevent Unnecessary Travel of Dependents to this Theater", dated 22 May 1946 and 1st Indorsement, AG 230 GILCOF, (22 May 46), this headquarters, dated 25 May 1946.
- d. Circular Number 97, Headquarters, United States Forces, European Theater, dated 28 June 1946.

2. It has come to the attention of this headquarters that current instructions on billeting of dependents as published by this and higher headquarters are not being followed. The instructions contained in the references in paragraph 1 above will govern all movement and billeting of dependents.

3. It is the policy of this headquarters that dependents once approved for shipment to this theater will be afforded billet accommodations, so long as applicant is assigned to Third United States Army or remains in a Third United States Army community upon subsequent transfer to an organization not under Third United States Army.

a. If an application for shipment of dependents has been approved by this headquarters and the applicant is subsequently transferred to an organization not in Third United States Army Area, but remains in a Third United States Army community, billet accommodations will be provided.

b. If an application for shipment of dependents has been approved by an organization not in Third United States Army and the applicant is subsequently transferred to a Third United States Army unit, billet accommodations will be provided.

4. Upon reassignment of an individual having dependents present in the theater, the individual will:

Transportation to Zone of Interior of Personnel Accompanied by Dependents.....I
Requisition of Prophylactics.....II
Rations and Messing.....III

I - TRANSPORTATION TO ZONE OF INTERIOR OF PERSONNEL ACCOMPANIED BY DEPENDENTS

1. Policies concerning embarkation of personnel entitled to government water transportation when accompanied by dependents likewise entitled to government transportation are as follows:

a. Dependents returning under provisions War Department Circular 83, dated 22 March 1946 (War Brides and similar Categories) are authorized transportation only on vessels designated by the War Department for such purpose.

b. Personnel moving to Zone of Interior concurrently with dependents (reference sub-paragraph a above) will be embarked on board same vessel whenever possible, without displacing other dependents scheduled for vessel. This is not to be construed as a directive that such personnel must be loaded on the same vessel or that if they are so loaded they will occupy the same stateroom.

c. Dependents returning to the Zone of Interior under directives other than War Department Circular 83, dated 22 March 1946, will be returned on any army controlled vessel on which suitable space is available. Personnel accompanying their dependents will be embarked on same vessel whenever possible without displacing personnel with a high priority. This is not to be a directive that such personnel will occupy the same stateroom.

2. Port and transport loading authorities will make every effort to accommodate dependents together; however, their discretion and decision in matters pertaining to space assignment on vessels will be complied with.

3. Authority: Radiogram SC-33764, Headquarters, United States Forces, European Theater, dated 19 July 1946.

or venereal disease control officer is attached to the effect that this amount is necessary for the health of the command. All units should requisition sufficient quantities to meet their requirements.

"Organization commanders will insure that prophylactic materials are not used for purposes other than those intended."

MED

III - RATIONS AND MESSING

1. The attention of all concerned is directed to the provisions of Paragraph 3, Section IV, Circular 44, Headquarters, United States Forces, European Theater, dated 5 April 1946, subject same as above, which reads as follows:

"3. Disposition of Excess Stocks. Excess non-perishable subsistence items on hand in unit storerooms or Army dumps will be disposed of:

- a. By return to Class I depots, as directed by local commanders,
- or b. By listing such excess subsistence on the reverse side of ration return (OTCCM Form Number 4)".

2. Commanders of all echelons will take immediate action to assure that units under their command eliminate excess non-perishable subsistence items in unit storerooms by:

- a. Turning in to community supply point all items in excess when they cannot be consumed in accordance with the prescribed menu within one week.
- b. Listing all items on reverse of ration return that are excess but can be consumed in accordance with prescribed menus within one week.

3. Community supply points will take action as follows:

- a. Accept all non-perishable subsistence items turn in as excess under the provisions of paragraph 2a above.
- b. Properly edit unit ration returns (OTCCM Form Number 4) to assure that necessary deductions are made in unit ration issues, taking into consideration the excess items listed on reverse side of ration return in accordance with paragraph 2b above.

SOP for Liaison Officers
to Public Health Branch, Office Military Government
for
Each of the Laender.

GENERAL:

To insure closer coordination and cooperation in Public Health matters, particularly those pertaining to venereal disease control, between Military Government and Third United States Army, liaison officers have been selected to represent Third United States Army at the Office of Military Government for each of the three Laender.

a. This officer has been placed on duty at the request of the Directors of Military Government for the Laender for the purpose of reviewing and investigating the frequent problems pertaining to venereal disease control which concern both the Army and the civilian population.

b. It is to be definitely understood that this officer will not perform duties which do not concern the Army or work on projects or problems which are strictly Military Government in nature.

FUNCTIONS:

Specific duties and functions of the liaison officer are outlined as follows:

a. Inform Third US Army units as to Military Government regulations, policies and problems on venereal disease control and other public health matters. This can best be accomplished by personal contact with unit commanders and unit surgeons.

b. Investigate and follow-up problems on venereal disease control which pertain to the contact of Army units or personnel with civilians or Military Government.

c. Inform Military Government as to Army activities and policies in venereal disease control and determine their viewpoint on these policies.

d. Inspect venereal disease diagnosis and treatment centers to insure that venereal contacts are properly admitted, diagnosed, treated, and released only when non-infectious.

e. Inform Army as to the disease trends among the civilian population and report the location and details of any outbreaks of communicable disease which may be a threat to the health of the command.

(Over)

f. Inform Army as to supply problems as they relate to the adequate treatment of venereal disease and the control of other communicable diseases, if the deficiencies which exist will ultimately affect the health of the Army.

g. Inform the troops as to the proper procedure in the apprehension of venereal contacts and the places to which these cases should be taken for examination and treatment.

h. Submit a weekly report of activities to the Surgeon, Third United States Army stating the details of problems encountered and action taken. This report will include as inclosures any pertinent reports or data on public health matters which will be of interest.

i. Personally report to the Army Surgeon at least once a month to discuss current activities and problems. This will usually be the day prior to the Third United States Army Venereal Disease Control Board meeting which the liaison officer will attend.

OTHER MAJOR COMMANDS:

The liaison officer will act as a representative not only for Third Army but will assist other United States Army units in problems concerning both the Army and Military Government.

TRANSPORTATION:

Pursuant to agreement, transportation will be provided to the liaison officer by the Office of the Military Government for the Laender.

AG 726.1 GEN CW-3

2 January 1947

SUBJECT: Apprehension and Disposition of Venereal Disease Contacts.

TO : See Distribution.

1. General:

Lack of uniform procedure in control of venereal disease contacts and suspects, resulting in poor coordination between tactical units, Military Government and civilian agencies concerned has been noted by this headquarters. The proper measures to be taken are set forth below for your information and guidance.

2. Civilian Venereal Disease Agencies:

a. In Land Württemberg-Baden, specific Venereal Disease "examining centers" have been established for the purpose of conducting the necessary physical examinations on venereal disease contacts and suspects. Some of these examining centers are at the local venereal disease hospitals but others have separate locations as indicated in the inclosed list. In the Laender Bavaria and Greater Hesse both examination and treatment of cases is accomplished at the listed hospitals; however, in some instances preliminary examinations are conducted at local police stations.

b. Contacts and suspects picked up on vice raids will be taken to the nearest venereal disease agency listed. Contacts should be taken to an examining center first, but if no examining center is listed (e.g. in Bavaria and Greater Hesse) they should be taken to the nearest venereal disease hospital.

c. The list of Military Government controlled, official civilian venereal disease agencies is shown in Inclosure Number 11. All other hospitals are prohibited from accepting contagious venereal disease cases.

3. Military Government Policy Governing Release of Venereal Disease Patients.

a. All named or known contacts will receive a minimum of three (3) examinations for gonorrhea at 24-hour intervals and a serological test for syphilis.

- (1) Contacts showing a single positive smear will be treated.
- (2) Contacts showing three (3) consecutive negative smears will be released.

(3) Contacts which are considered positive after laboratory examination by an officer of the Medical Corps, United States Army, will be treated even if the doctor at the treatment center does not agree with the diagnosis.

b. All venereal disease suspects picked up on the street raids will be given a minimum of one (1) examination for gonorrhea.

(1) If the smear is negative, they will be released.

(2) If the smear is doubtful, it will be repeated on three consecutive days and treatment will be instituted if any smear is positive.

(3) If the smear is positive, the patient will be detained for routine treatment.

c. It will be noted that these regulations permit the release of a venereal disease suspect within 24 hours, whereas a contact must be detained for a minimum of three days. Then instances arise in which apprehended women are not given the proper examination, unit commanders will inform this headquarters, or, preferably, the Third US Army liaison officer, stationed at the Public Health Branch, Office of Military Government for each Land, so that corrective action may be taken. Unit commanders are authorized to communicate directly with local Military Government officials concerning venereal disease problems; however, corrective action will not be initiated against any civilian agency except by Military Government.

d. Third US Army liaison officers may be contacted as follows:

(1) Office of Military Government for Wurttemberg-Baden:
Capt. Albert Dresner, MC, Telephone: Stuttgart 93221,
Extension 392.

(2) Office of Military Government for Bavaria: Major Albert
Eisner, MC, Telephone: Munich 4472.

(3) Office of Military Government for Greater Hesse: 1st Lt.
Robert Bazzanella, MC, Telephone: Wiesbaden 7151, Ext.
417 or 244.

4. Conduct of Vice Raids.

a. The apprehension of venereal disease suspects is primarily a function of the civilian police. Military law enforcement agencies have current jurisdiction in such matters and may make apprehensions if the police are not able to take the desired action. German Police will accompany every military detachment which is engaged in arresting venereal disease suspects.

Apprehension of individual women who have been named as contacts must be accomplished by a party consisting of the soldier

5.1 GNMCM-3 Third US Army 2 Jan 47 "Apprehension and Disposition of Venereal Disease Contacts"

ing the contact, the unit venereal disease control non-commissioned ser and a German Policeman, the latter making the arrest.

c. No large scale vice raid will be conducted without a prior clearance from the Public Health Branch, Office of Military Government for the proper Land, in order that personnel and equipment of examining centers and venereal disease hospitals can be prepared to handle the large influx of patients resulting from the raid.

d. The assignment of "quotas" to law enforcement agencies, or other practices which result in the indiscriminate apprehension of civilian women as venereal disease suspects, is not to be condoned.

e. Preparation of more complete contact histories by unit medical officers, and coordination with the local military police and Military Government authorities to supply them with information from contact histories, will improve the apprehension program.

5. Lists of names or pictures of venereal disease contacts may be used at the discretion of unit commanders, but they will not be publicly displayed so as to bring disgrace upon the women so listed. In no case will they be displayed on the exterior of buildings in public view.

6. Interference with the German police to prevent or obstruct the apprehension of any civilian arrestee is specifically prohibited. Commanders will take prompt and vigorous corrective action in any case where troops interfere illegally in German police activities, the operation of civilian jails or civilian hospitals.

FOR YOUR OWN GOOD —

Annex 35 (cont'd)

Make a habit of refreshing your memory on facts about venereal disease (VD). It may well be the finest and least expensive insurance you've ever had.

No **thinking** man will ever make fun of a subject that so vitally concerns the future welfare and happiness of his loved ones and himself. If **that** isn't important, **nothing** is!

You don't want VD. No one does. But the "wise guy", who thinks he leads a charmed life, goes around taking chances, and winds up with **trouble** in the form of VD. Sure, he's an expert — he can tell a "clean" girl every time — something even his doctor can't do without laboratory tests.

But "wise guy's" luck runs out — it always does. **No one** is immune to VD, whether he's had it before or not.

Don't be deceived by appearances. Any girl, whether she's a prostitute, a "pick up" or a home girl, can carry a venereal disease around without being sure about it herself. So how can **you** be sure she hasn't got it?

Under present conditions, it's easy to find a girl that's "willing" — the chances are that she's been just as "willing" in the past, although she'd be the last one to admit it. A lot of them **know** they're infected and think it quite a clever trick if they can pass on VD to American soldiers, whom they still secretly consider enemies.

Would **you** deliberately trade a few moments of pleasure for a lifetime of regret? Certainly not, unless you're a complete fool. Yet, that's exactly what you may be doing when you do business with an unknown quantity — playing a losing million-to-one shot.

Syphilis can lead to **insanity** or **paralysis**. Gonorrhoea can be the cause of **blindness** or may keep you from becoming a father if you should ever want to have a family. Treatment with penicillin is **no positive guarantee** against a future relapse, no matter what the "wise guys" tell you.

The **surest** way of avoiding VD is by **not having sexual intercourse** outside of marriage. The moral and religious laws you've been taught tell you that it is wrong to steal. It is **just as wrong** to have sex relations outside of marriage — you are still **breaking those laws**, and sooner or later you'll have to pay for it. Don't ask for trouble.

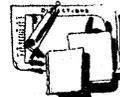

Veneral disease rates on the Continent are **dangerously** high — a result of wartime conditions. Without a doubt, this is the poorest time and place in the world to "play around". But — a few short-sighted men will insist on "playing with fire" and exposing themselves. For the good of this group, the following rules should be used **without exception**:

1. Use a **rubber (condom)** during each sexual contact. Get it at your PX or through your unit.
2. Carry a **Pro-Kit** with you. Your unit has them.
3. Urinate **immediately** after exposure.
4. Also, immediately after each exposure, open your Pro-Kit and use the soaped cloth in it to wash your sex organs, belly and thighs thoroughly. (If water isn't handy, use the rest of the Kit anyway).
5. Squeeze one fourth of the ointment from the tube into the penis opening. Compress tip of penis and hold in for 3 to 5 minutes, massaging gently.
6. Rub the rest of the ointment from the tube all over your penis and the parts around it thoroughly.

(Using a rubber AND a Pro is much safer than either one used alone)

If at all possible, get your Pro at your Army Pro Station — they'll do a better job of it. This GREEN LIGHT Station is open 24 hours a day for your protection. Your medical record is **SECRET**.

Whether you've taken the proper precautions or not, watch yourself carefully — if you **should** become infected, report to your Medical Officer **immediately**. This is **very important**, as even a short delay will slow up your recovery.

Remember — CONTINENCE (No sexual intercourse) is the surest way of avoiding VD. Be CLEAN when you go home to your loved ones

SUBJECT : Collection of Water Samples in Military Communities
and Satellites.

TO : See Distribution.

1. There has been extreme laxity in the collection of samples for bacteriological examination of the municipal water supplies serving the Military Communities and their satellites. The failure to collect samples is slowing down the process of approving these supplies. Before this Headquarters can approve water supplies a resurvey must be made by an officer from the Surgeon's office this Headquarters, and unless a history of bacteriological examination of the water is available approval must be withheld pending the completion of the history.

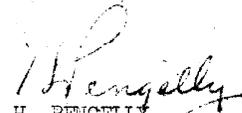

2. It is the responsibility of the Community Surgeon to submit water samples in the quantity and to the nearest laboratory listed in Circular 43, Headquarters, U.S. Forces, European Theater, Subject: "Water Supply", dated 3 April 1946.

3. Reference will be made in the Military Community Monthly Sanitary Report (WD AGO Form 8-140) as to the number of samples taken during the month and the results. Note will also be made on the number of residual chlorine tests made, the range of results, and the average of results.

4. This letter is authority for submitting raw water samples to the laboratory for bacteriological examination from any Third U S Army Military Community or Satellite.

5. Complete instructions on the taking of water samples is included in paragraph 15, Section XI, Circular Letter 38, Headquarters U S Forces, European Theater, Office of the Chief Surgeon, dated 1 August 1946.

I - REENLISTMENT LEAVES TO THE ZONE OF INTERIOR

1. Rescissions:
 - a. Section II, Bulletin Number 133, this headquarters, 5 July 1946.
 - b. Section III, Bulletin Number 152, this headquarters, 3 August 1946.
 - c. Section IV, Bulletin Number 161, this headquarters, 13 August 1946.
2. Personnel who enlisted prior to 15 August 1946 for 18 months, two years or three years and deferred their reenlistment furloughs may be returned to the Zone of Interior for purpose of taking reenlistment leaves, provided enlisted man so desires and on the date mutually agreed upon by the enlisted man and the immediate commander.
3. Such persons will be processed under provisions of Section III, Circular Number 300, War Department, current series, except that part of paragraph 40b (1), which states that individual must be eligible for rotation.
4. Amount of leave will be computed as outlined in paragraph 4h, Army Regulations 600-115. Only proportionate part of thirty days leave in advance of accrual will be granted when less than one year future service remains.
5. Commanders concerned are hereby authorized to return such individuals along with normal redeployment shipments. Additional quotas may be requested from G-1 Military Strength Control, this headquarters, through normal channels for requesting redeployment quotas.
6. Orders will cite War Department Cable WCL-24158, 6 December 1946, as authority and will specifically state whether the individual will be returned to this theater or reassigned in Zone of Interior under provisions of Section VII, Circular Number 265, War Department, current series.
7. The provisions of Section II, Bulletin Number 196, this headquarters, 10 October 1946, as amended by Section I, Bulletin Number 205, this headquarters, 12 October 1946, which pertain to ordinary leaves and furloughs to the Zone of Interior are not changed by this circular.
8. Authority: Radiogram SC-25719, Headquarters, U. S. Forces, European Theater, 16 December 1946.

II - WATER DISCIPLINE

1. There have been instances noted of laxity in the enforcement of water discipline in this command. Water is being used by personnel without regard to the source and whether or not it is approved and properly chlorinated. Due to the high incidence of water-borne diseases, such as typhoid fever and dysentery in Germany, it is extremely important that water discipline be rigidly enforced.

2. Municipal supplies can be approved only by the Surgeon of a major command (Reference Circular Number 43, Headquarters, U. S. Forces, European Theater, subject: "Water Supply", dated 3 April 1946). Before such a supply in a Third United States Army community can be approved it must be surveyed by a representative of the Army Surgeon. In addition, a history of bacteriological and chlorine residual tests must be obtained by the local Surgeon. At such time as a supply is approved by this headquarters, the local commanding officer will be notified so the information can be disseminated to all concerned. Until approval, all taps in quarters, mess halls and bars will be marked "Not Potable, Do not Drink". At the present time only the water supplies of the Third United States Army communities of Darmstadt and Heidelberg are approved.

3. At all other installations until the municipal supply is approved water for drinking or culinary purposes will be obtained from Engineer Water Points or will be treated with calcium hypochlorite ampules or water purification tablets as described in paragraphs 47 - 51, Field Manual 21 - 10, July 1945. REPORT OF OPERATIONS

8 May 1945 - 30 September 1945

1. The activities of the ~~Supply Division~~ Office of the Theater Chief Surgeon, for the period 8 May 1945 to 30 September 1945, are described herein.

2. This period covered the gradual functional transition from supplying the Armies and Communications Zone units and installations to re-deploying medical equipment until VJ Day, and, thereafter, the disposal of supplies and equipment by shipment to the United States, by turn-over to liberated countries, and by retention for supply of occupational troops.

3. The report of the Division is presented in sections, as follows:

Section I	Organization
Section II	Stock Control and Allied Functions
Section III	Depot Operations
Section IV	Issue of Supplies and Equipment
Section V	Finance Activities
Section VI	Medical Supply Activities in Germany
Section VII	The Picture in the United Kingdom

R. L. BLACK
Colonel, PC

SECTION - I

ORGANIZATION

8 Exhibits

- Exhibit 1 - Organizational & Functional Outline, Supply Division, 8 May 45
- 2 - Organizational Chart, Supply Division, 8 May 45
- 3 - Organizational & Functional Outline, Supply Division, 30 Sep 45
- 4 - Organizational Chart, Supply Division (Rear), 30 Sep 45
- 5 - Organizational Chart, Supply Division (Main), 30 Sep 45
- 6 - Roster of officer personnel, 30 Sep 45
- 7 - Roster of enlisted personnel, 30 Sep 45
- 8 - Roster of civilian personnel, 30 Sep 45

1. On 8 May 1945 (V-E Day) the Supply Division was composed of five branches with Col S. B. Hays as Chief of the Division.

Exhibit 1 is an organizational and functional outline of the Supply Division at that time.

Exhibit 2 is an Organizational Chart of Supply Division as of 8 May 1945

a. The five branches were:

- (1) Administration and Finance Branch, Captain C. T. Lawson, Chief.
- (2) Depot Technical Control Branch, Lt Col Allen Pappas, Chief.
- (3) Issue Branch, Maj R. L. Parker, Chief.
- (4) Stock Control Branch, Lt Col L. H. Beers, Chief.
- (5) Captured Materiel and Civil Affairs Branch, Maj W. R. Rivkin, Chief.

b. Twenty-nine (29) officers, eighty-one (81) enlisted men and women, two (2) British Civilians, and fifteen (15) French civilians comprised the staff. On 9 July, the Supply Division, less the Stock Report Section, was moved from Paris to Versailles.

2. The period 8 May to 30 September was marked by the instability of assignment of personnel, especially after VJ day when redeployment began in earnest. A total of 14 officers were lost from 8 May to 30 Sep thru transfers to the Zone of Interior for duty or discharge. They were replaced by 10 officers transferred in from the ZI and from units closing out. Of the eighty-one (81) enlisted personnel assigned on 8 May, only forty-nine (49) originals were still present for duty on 30 Sep, eighteen (18) having been lost through redeployment and fourteen thru normal transfers and hospitalization. Eighteen (18) new enlisted personnel were transferred in, four (4) from UK, eight (8) from ADSEC, and six (6) from medical field units.

3. On 15 August, Col S. B. Hays was transferred to duty in the Surgeon General's Office, Washington, DC, and Col R. L. Black, former Chief of Supply, Surgeon's Office, UK Base became the new Chief of the Division. Lt Col L. F. Hubener reported in from the Zone of Interior on 27 August and was appointed Deputy Chief of Supply Division for duty at Frankfurt.

4. On 16 June, Major R. L. Parker, Chief of the Issue Branch was transferred to the Zone of Interior for duty in the Surgeon General's Office. He was replaced by Major T. B. Stewart. On 17 September, Maj Stewart was transferred to the 30th Medical Depot Co, Weinheim, Germany, and Capt M. A. Fortner became the Chief of the Issue Branch. On 30 July Captain R. S. Kribs, Chief of the Catalog and Equipment List Section of the Issue Branch was transferred to the Surgeon General's Office for duty

at the St. Louis Medical Depot. The functions of his section were absorbed by the Requisition Section. Major G. E. Schuck, Chief of the Requisition Section of the Issue Branch was transferred out for redeployment on 27 August and Captain K. Bowenschulte, formerly with the Surgeon's Office, Hq UK Base, became chief of the Requisition Section.

5. On 12 September, Lt Col L. H. Beers, Chief of the Stock Control Branch, and Deputy Chief of the Supply Division (Rear), was transferred to the Surgeon General's Office for duty. He was succeeded by Maj G. C. Parmelee (Frankfurt) Chief, and Maj C. R. Barkley (Versailles) Acting Chief of Stock Control Branch. On 28 Sep, Capt C. L. Hooker was redeployed to the United States and succeeded by Capt R. E. Pryor as Chief of the Depot Distribution Section. Maj J. B. Parks, Chief of the Stock Report Section, was returned to the United States thru hospitalization and was succeeded by Capt G. E. Merson who in turn, on 4 Sep was hospitalized and returned to the United States. Maj E. J. Selph, formerly of the Surgeon's Office, Hq UK Base, was made Chief of Stock Report Section, and on 8 Sep, Lt E. E. Salera was named Assistant. Capt R. J. Snowdon was appointed Chief of the Excess and Surplus Property Section on 13 Aug, vice 2nd Lt H. A. Fairbairn. On 23 Aug, Capt A. I. Weil reported for duty from the Zone of Interior and was appointed assistant to Capt. Snowdon. 2nd Lt. A. J. Morris transferred from the Requirements Section to the Excess and Surplus Property Section on 3 Aug, was redeployed to the United States. Mr. B. O. Byers, Assistant in the Air Section, was redeployed to the United States on 1 Sep, and the functions of the Section were transferred to the Depot Distribution Section.

6. On 28 Sep, Lt Col Allen Pappas was transferred to the Surgeon General's Office and was succeeded by Maj W. T. Gaudy as Chief of the Depot Technical Control Branch. At this time the Procurement Section of the Stock Control Branch was transferred to the Depot Technical Control Branch. On 3 Jul, Maj O. A. Parssinen was appointed Field Representative to aid depots in closing out. On 22 July, Capt H. J. Mapes was transferred to Medical Depot M-424 in U.K., and was succeeded by Capt W. J. Rowe as Chief of Maintenance and Repair Section. Lt L. A. W. Corbin, who reported for duty on 13 July was appointed Assistant, Maintenance and Repair Section. Capt M. A. Battestin reported for duty and was appointed Chief, Packing Crating and Marking Section vice 1st Lt S. E. Lobree. On 25 Sep, Capt D. McGregor was redeployed to the United States and was succeeded by Capt M. A. Battestin as Chief of the Depot Systems and Statistical Section. Lt P. M. Siegel, assigned to Supply Division but on duty at Medical Depot M-412, was transferred on 27 Jun to the 828 Conv Center, but remained on Detached Service at M-412.

7. 1st Lt Martin L. Hildreth, formerly of the Surgeon's Office, Hq, UK Base, was transferred to this Division and became Assistant Chief of the Finance Section (Versailles) on 27 Jun. With his transfer, the function of recording and reporting on British Reciprocal Aid and Lend-Lease activities was also transferred.

8. On 13 July, the Supply Division office that was to become Supply Div, TSFET (Main) was begun in Wiesbaden by placing the following personnel on indefinite Detached Service to the 12th Army Group:

Major G. C. Parmelee
Major W. R. Rivkin
T/3 John A. Brewer
T/4 James D. Faber
T/5 Jack Poisnick

Later additions were as follows:

Capt L. P. Solinger	27 July
Pfc T. D. Hathaway	2 Aug
Pfc H. E. Spohn	4 Sep

On 15 August this office of TSFET (Main) moved to Frankfurt.

9. Of note was the increase in size of the Excess and Surplus Property Section from one officer on 8 May to three officers, eight enlisted men, one British Civilian, and one French civilian on 30 September.

10. On 30 September 1945, the Division was composed of twenty-five (25) officers, sixty-seven (67) enlisted men and women, four (4) British civilians, and seven (7) French civilians. Exhibit 3 is an Organizational and Functional Outline of the Supply Division as of 30 September. Exhibits 4 and 5 are Organizational Charts of the TSFET (Rear) and (Main) offices of the Supply Division as of 30 September. Exhibits 6, 7, and 8 respectively are rosters of officer, enlisted, and civilian personnel of Supply Division as of 30 September.

SUPPLY DIVISION

HEADQUARTERS
EUROPEAN THEATER OF OPERATIONS
Office of the Chief Surgeon
APO 887

8 MAY
~~28 March~~ 1945

COLONEL S. B. HAYS, CHIEF (3285* or PASSy 6692)
~~COLONEL B. C. T. FENTON, DEPUTY CHIEF (3296 or PASSy 6692)~~

Supervises the operation of the Medical Supply System of the ETO, including:

1. Determination of Theater requirements and excesses of military medical supplies.
2. Procurement of military and Civil Affairs medical supplies.
3. Distribution, storage and issue of military and Civil Affairs medical supplies.
4. Receipt, classification, storage and disposition of captured medical supplies.
5. Supervision of obligation of MDA funds and accounting of lend lease and reciprocal aid transactions.

* * *

BRANCHES OF THE SUPPLY DIVISION

ADMINISTRATION AND FINANCE BRANCH

CAPTAIN C. T. LAWSON, CHIEF (3284 or PASSy 9426)

1. Performs administrative functions required by the Supply Division, including review and distribution of all correspondence, the preparation of various recurring and special reports and supervision of Division's central files.
2. Initiates actions, maintains records and compiles reports on Division's officer and enlisted personnel.

* Telephone Extension Numbers on Com Z Exchange are indicated. Exchange Number is BALzac 5200 or 5400.

*Exhibit 1.
Section I*

Administration and Finance Branch (Contd)

3. Prepares or edits and makes distribution of Depot Information Letters.

FINANCE AND RESEARCH SECTION

LT L. P. SOLINGER, CHIEF (3284 or PASsy 9426)

1. Maintains records and prepares reports of fiscal obligations for submission to the Fiscal Director, Headquarters, ETOUSA.
2. Maintains records of Lend-Lease and Reciprocal Aid transactions with Allied Governments, including preparation of bi-monthly Lend-Lease reports on issues of medical items from theater stocks to Allied Governments, and quarterly Reciprocal Aid reports on receipts of medical items by U. S. Forces from Allied Governments.
3. Maintains liaison with GPA and Fiscal Director's Office on fiscal, lend-lease and reciprocal aid procedures.
4. Performs research and investigations for the division on matters requiring statements of policy and procedures.

* * *

CAPTURED MATERIEL AND CIVIL AFFAIRS BRANCH

MAJOR W. R. RIVKIN, CHIEF (3120)

1. Establishes procedure and policy for classification, storage and issue of captured enemy materiel.
2. Supervises the procurement of Civil Affairs medical supplies from the United States and the U. K. and supervises their storage and issue.
3. Processes requisitions for captured and Civil Affairs supplies from Allied Governments, and maintains liaison with Allied Government officials regarding requirements for civil affairs medical supplies.

* * *

DEPOT TECHNICAL CONTROL BRANCH

LT COLONEL ALLEN PAPPAS, CHIEF (3272 or PASsy 9391
PASsy 7038)

Depot Technical Control Branch (Contd)

1. Establishes policies and procedures for technical operation of depots.
2. Inspects depots for compliance with operational directives and renders reports for necessary modifications in technical aspects of operation.
3. Maintains liaison with ports, depots and transportation agencies in order to coordinate and expedite shipments.
4. Surveys anticipated depot areas for installation sites.
5. Coordinates with AC of S, G-4, allocation of desirable sites for medical depots and allied installations.
6. Supervises the maintenance and repair of medical equipment.
7. Establishes assembly, packing and marking methods and procedures.

DEPOT SYSTEMS AND STATISTICAL SECTION

CAPTAIN DAVID MCGREGOR, CHIEF (3272 or PASSy 9391, PASSy 7038)

1. Develops procedures for record keeping and document flow in depots.
2. Assists depots in problems of document procedures.
3. Supervises maintenance of accurate depot inventories.
4. Assembles statistics on depot operations.
5. Prepares consolidated reports for Office of the Chief Surgeon, G-4, and other interested agencies.
6. Estimates requirements of depot upkeep materials.

MAINTENANCE AND REPAIR SECTION

CAPTAIN H. J. MAPES, CHIEF (KLEber 9455)

" W. J. ROWE ASST

1. Establishes policies and procedures for technical operation of maintenance sections and teams.
2. Supervises the requisitioning, storage and issue of spare parts to lower echelons.

Maintenance and Repair Section (Contd)

3. Prepares spare parts catalogs and publications for distribution to using agencies.
4. Conducts studies and maintains statistics on adequacy and adaptability of equipment in use.

SUPPLY MOVEMENT CONTROL SECTION

MAJOR W. T. GAUDY, CHIEF (KLEber 9488)

1. Maintains liaison with consignors, transportation agencies and consignees to insure the arrival at destination of rail and truck shipments.
2. Initiates tracer action to locate lost shipments.
3. Advises depots on shipping addresses and proper methods by which shipments may be made.

PACKING, CRATING AND MARKING SECTION

LT S. E. LOBREE, CHIEF (KLEber 9488)

1. Coordinates plans and procedures for packing, crating and marking of equipment and supplies for Post-VE Day redeployment.
2. Supervises operation of mobile packing squads and processing installations.
3. Estimates requirements for packing, crating and marking materials.
4. Investigates commercial packing and processing facilities.

* * *

ISSUE BRANCH

MAJOR R. L. PARKER, CHIEF (3276)

1. Supervises initial issue of supplies and equipment to new field units arriving in the theater.
2. Supervises the movement of hospital and similar unit assemblies upon their arrival in the theater until their delivery to sites.

Issue Branch (Contd)

3. Supervises the processing of requisitions for hospitals and field force units.
4. Supervises the procurement, issue and storage of blank forms and distribution of catalog and equipment lists.

CATALOG AND EQUIPMENT LIST SECTION

CAPTAIN R. S. KRIBS, CHIEF (3273)

1. Establishes theater levels for Medical Department Blank Forms and supervises procurement, production, storage and issue of such forms.
2. Makes distribution of ASF Medical Department Supply Catalog and changes thereto.
3. Maintains master file of Medical Department equipment lists, Sub-number Catalog, ETO Non-Standard Catalog and other Supply Division publications, and compiles, edits and supervises distribution of such publications.

REQUISITION SECTION

MAJOR G. E. SHUCK, CHIEF (3275)
CAPTAIN M. A. FORTNER, ASSISTANT (3275)

1. Processes requisitions for all static medical installations on the Continent.
2. Processes all field equipment requisitions.
3. Initiates action and directs shipment of shortages in hospital and other type assemblies after their arrival at site.
4. Initiates issue of assemblies, such as expansion units, infirmaries and dispensaries, and follows up to fill shortages upon their arrival at destination.
5. Maintains liaison with Medical Supply Officers of Bases and Sections, Hospital Centers and Installations for compliance with "Medical Supply Manual for Fixed Medical Installations Other than Depots", and makes necessary inspections to see that correct policies and procedures are being followed.

UNIT ASSEMBLY SECTION

CAPTAIN M. A. FORTNER, CHIEF (3275)

1. Maintains contact with Transportation Corps to obtain priority for movement of unit assemblies to site of operations.
2. Coordinates, traces and expedites the movement of all Medical Unit Assemblies, arriving on the Continent.
3. Maintains contact with Operations Division, Office of the Chief Surgeon, to enable the Unit Assembly equipment of hospitals to be married with personnel.

* * *

STOCK CONTROL BRANCH

LT COLONEL L. H. BEERS, CHIEF (3283)

1. Supervises computation of Theater Stock Level and maintenance of depot stock levels.
2. Supervises the processing of requisitions for Army Medical Depots which are extracted from the Com Z depots supporting the Armies.
3. Supervises the computation of requirements for Medical Supplies in the Theater and reviews maintenance factors as based on issues.
4. Supervises procurement of medical supplies from civilian sources.
5. Supervises the preparation of consolidated stock status reports, for the Com Z.
6. Determines which items are in excess of Theater requirements and submits reports to higher authority for disposition.

REQUIREMENTS SECTION

MAJOR G. C. PARMELEE, CHIEF (3287 or PASsy 9441)
CAPTAIN R. J. SNOWDEN, ASSISTANT (3287 or PASsy 9441)
LT H. A. FAIRBAIRN, ASSISTANT (3287 or PASsy 9441)
LT E. F. MORAIRTY, ASSISTANT (3287 or PASsy 9441)
MR. A. J. MORRIS, ASSISTANT (3287 or PASsy 9441)

1. Computes Theater stock levels on the basis of the U. K. and the Continental requirements.
2. Establishes distribution depot stock levels for the Continent.
3. Reviews and revises item maintenance factors on the basis of issue rates.
4. Computes Theater stock requirements and submits requisitions for supplies to Pembark for the U. K. and the Continent.
5. Maintains records of "dues-in" for items on requisition from the United States and British procurement.
6. Prepares reports on overall status of stocks and back orders.
7. Prepares various recurring and special reports on the status of medical supplies in the Theater.
8. Requisitions supply requirements from other services.

DEPOT DISTRIBUTION SECTION

MAJOR C. R. BARKLEY, CHIEF (3290 or PASsy 9377)
CAPTAIN C. L. HOOKER, ASST (3290 or PASsy 9377)
LT J. M. CHICK, ASSISTANT (3290 or PASsy 9377)
LT S. LIBERSON, ASSISTANT (3290 or PASsy 9377)

1. Maintains depot stock levels by (a) distribution of supplies received from the United States and the U. K. and (b) by inter-depot transfers.
2. Reviews consolidated stock status report for inaccuracies and directs extraction of back orders where required.
3. Receives and processes requisitions for Army Medical Depots which are extracted to this office.

STOCK REPORT SECTION

CAPTAIN J. B. PARKS, CHIEF (3291)
CAPTAIN G. E. MERSON, ASSISTANT (3291)

1. Prepares consolidated stock status report for (a) the Continent and (b) U. K. depots on EAM equipment.
2. Prepares special reports on EAM equipment as required by this division.
3. Prepares rosters of Medical Department Officers for the Personnel Division, Office of the Chief Surgeon.

PROCUREMENT SECTION

MAJOR W. T. GAUDY, CHIEF (PASSy 9472)

1. Submits programmed requirements to GPA for transmittal to French authorities, as authorized by Requirements Section.
2. Prepares and submits requirements for spot demands under field procurement procedures to Service D'Aide Aux Forces Allies.
3. Maintains liaison with contractors for scheduled deliveries of programmed requirements accepted by the French Government.
4. Prepares procurement reports as required by the GPA.
5. Coordinates procurement by theater medical units in accordance with policies and procedures established by higher authorities.

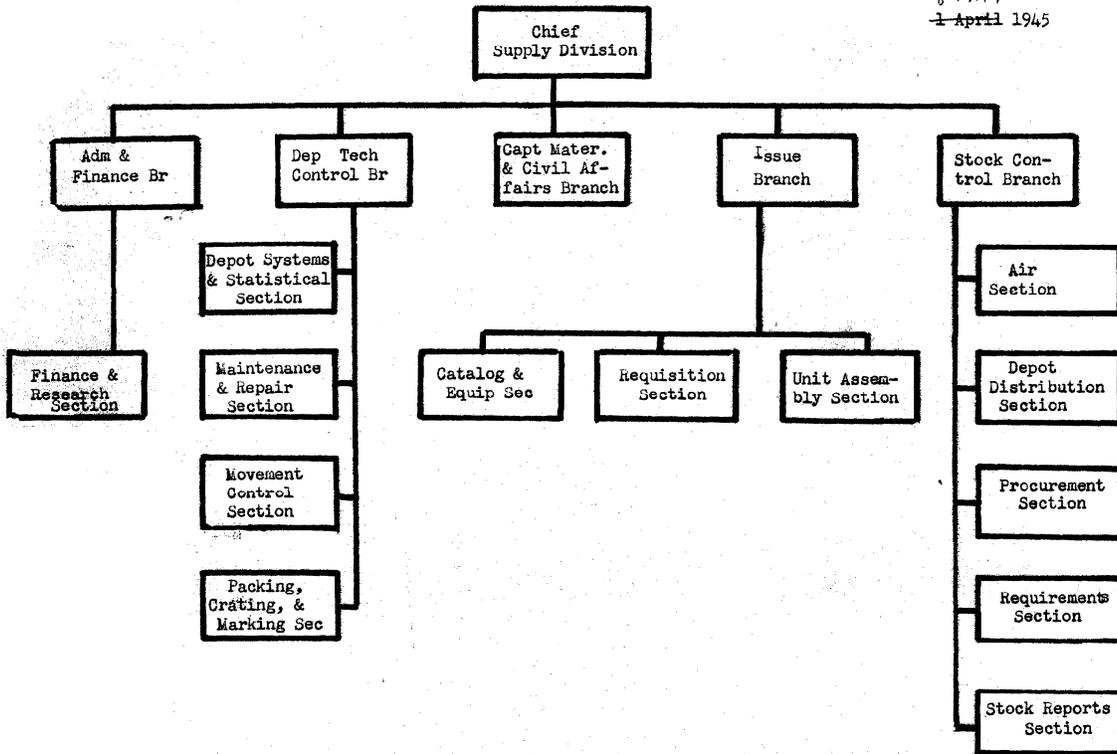

AIR SECTION

LT R. E. PRYOR, CHIEF (3278)
MR B. O. BYERS, ASSISTANT (3278)

1. Maintains liaison with CATOR and Air Force Units.
2. Secures air lift for delivery of whole blood and urgently needed medical supplies.
3. Coordinates loading and offloading activities at air fields with Office of the Chief Surgeon.

1. INTRODUCTION

On 8 May 1945 (VE-Day) the Medical Department had ample stocks on hand for supply of all U. S. troops and other personnel charged to the U. S. Army for supply. During the ensuing period up to 30 September 1945 normal stock control functions continued and in addition the plan for redeployment of troops and disposal of supplies excess to the needs of the theater were put into effect. During this period also the Army depots were consolidated into permanent depot sites and were brought under the centralized stock control of this office.

2. THEATER STOCK CONTROL PROCEDURES

a. Replenishment of Theater Stocks

Upon termination of the war in Europe it became apparent that many items then on requisition from the United States would not be required by the theater for either redeployment of troops or for the occupational force. It was therefore determined to cancel all existing requisitions as of VE-Day and to recompute the needs of the theater on a non-operational basis. This was accomplished by 15 July 1945 when the first post war requisition was submitted to PEMBARK. Thereafter requisitions were submitted on the 15th of each month. The procedure for determination of quantities of items needed was as follows:

(1) Reorder Point and Requisitioning Objective

(a) Reorder Point - A 60 Day level of stocks was authorized for this theater, plus 120 days for order and shipping time from the United States, giving a reorder point of 180 days.

(b) Requisitioning Objective - The reorder point was converted into the quantity of each item required for the number of troops in the theater, which furnished a requisitioning objective for each item. This was accomplished by adding the forecasted theater troop strengths in thousands for 6 months (180 days) and multiplying this figure by a factor which represented the quantity of the item required per thousand men per month. For example, the requisitioning objective on Item 1010000, Acetylsalicylic Acid tablets, with a factor of 8.5000 for the troop strengths indicated below would be computed as follows:

January	2,900,000	Troops
February	2,600,000	
March	2,300,000	
April	2,100,000	
May	1,900,000	
June	<u>1,700,000</u>	
	13,500,000	Troops

13,500 X 8.5000 = 114,750 Requisitioning Objective

The factors used during the operation were based on "Theater of operation factors" furnished by the War Department and revised by issue experience in the theater. In the post-operational period starting with VE-Day the War Department directed that the "Zone of Interior Factors" be used for troops not remaining in the theater and that "Theater of Operation Factors" be used for the occupational force. In many cases it was found that the "Zone of Interior" factors were higher than the "Theater of Operations" factor as modified by experience. It was therefore determined by the Supply Division to use the lower of the two factors for all troops in the theater. During the entire period from VE-Day this office continued to receive reports from all depots on the quantities of all items issued. These were transposed into a factor expressed in thousand men per month and were compared with the factors then in use. No changes in these factors were made until the latter part of August, when it was felt that sufficient experience in peacetime factors had been gained to justify a change. The "Report of Material Consumed" required by the War Department was submitted monthly. This report covers a selected list of items and shows the issues on these items and the factors derived from them plus any recommended changes this office may desire to make.

(2) Requisitioning Procedure

The determinations of items and quantities to be requisitioned from the United States was computed by adding the amount of stock on hand to the amount due in to the theater and balancing this sum against the requisitioning objective for the item. Where the amount on hand and due in was less than the requisitioning objective the quantity short was placed on requisition.

b. Stock Distribution

As stocks were received from the Zone of Interior they were sent to base or key depots. From these depots they were distributed to filler depots in order to make them available for issue to units. Also where unequal issues caused filler depots to become exhausted on certain items, distribution of these items was initiated to make them available. Immediately following VE-Day the Field Armies began to consolidate depots and dumps into permanent sites. Four depots were set up in Germany at Bremen, Berlin, Weinheim, and Furth. Stocks of U. S. Army supplies in Germany were concentrated at these issue depots and replenishment was accomplished by requisitions prepared by these depots and sent back to supporting filler depots. Shortages which could not be furnished from filler depots were extracted to the Chief Surgeon's Office where shipments were initiated from other Com Z filler, base, or key depots. On 15 June 1945 the first stock status reports were received from Weinheim and Furth depots and were consolidated with Com Z depot stock status reports. (Shortly thereafter Bremen and Berlin submitted reports). This information was used in computation of theater assets for requisitioning from the Zone of Interior but replenishment of these depots was still continued on a requisition basis. By theater directive it was ordered that fixed installations in Germany be taken over by TSFET as of 1 September 1945; however,

Since this office was receiving sufficient information to bring these depots under centralized stock control, authority was requested to set up centralized stock control for these depots on 1 August 1945 though the depots did not come under TSFET command until one month later. This authority was granted and replenishment of German depots by requisitioning on filler depots was discontinued, and distribution of stocks initiated by this office. The procedure for establishing depot levels, consolidating depot stock status reports, and distributing stocks is as follows:

(1) Depot Levels

The requisitioning objective on each item established for the replenishment of the theater was based on 60 days stock on hand, plus 120 days order and shipping time. Therefore, one third of the requisitioning objective was taken as the total level of all depots which should be on hand. This figure was then broken down based on the percentage of troops in the theater served by each depot.

(2) Consolidated Stock Status Report

Twice monthly depots submitted to the Machine Records section of this office a stock status report showing stocks on hand, due in, back ordered, of each item. Once monthly they also reported quantities issued (par. 2.g. (1)(b), above). These reports were consolidated by electric accounting machines to show item number, description, and requisitioning objective for each item, followed by each depot symbol, with the quantity on back order, due in, the depot level, and on hand. These columns were totaled at the bottom so that the stock on hand, due in, and on back order for the theater showed up. A balance figure was then printed on the extreme right indicating the requisitioning objective plus back orders, minus stock on hand and due in. Where the requisitioning objective plus back orders, exceeded the stock on hand and due in, an asterisk was printed before the balance figure so that attention would be drawn to the item when preparing requisitions on the Zone of Interior.

(3) Transfer Requisitions

The consolidated Stock Status reports were reviewed by this office each time they were published. Each item was checked for stock on hand, due in, and on back order at each depot, and compared with the depot levels. Where stock assets did not equal the depot level, transfers of stock were made from depots where the assets exceeded the depot level. These transfers were prepared on requisition forms and three copies sent to the shipping depot for action. One copy was forwarded to the receiving depot which was immediately posted to stock record cards as due in, and so reported on subsequent stock status reports until stock was received and tallied in. At this time the "tally-in" was used as a voucher to reduce the "due in" figure and to increase the "on hand" figure.

c. Redeployment

On VE-Day, forecasts of troops to be moved directly and indirectly

to other theaters had been published and this office had checked the lists to determine that sufficient replacement items of equipment were available at the Base depots near the ports of Marseilles (M-452), Rouen and Le Havre (m-417), and Antwerp (M-409) to complete equipment of units leaving the theater. At this time the Assembly Area Command was not functioning and troops were moving directly to port staging areas. Units moving directly to other theaters took their full Table of Equipment with them and replaced unserviceable or lost items in these staging areas. Units moving thru the United States (indirectly) turned in all equipment to M-418 (Mourmelon) except minimum essential equipment, and shortages in these items were filled from port staging area base depots. These functions were handled largely on Base Section level except that transfers of stock were made from this office to replenish base depots. The exception to this procedure which was handled by this office was the equipping of hospitals. It was not felt that General and Station hospitals could adequately pack their equipment for direct movement to other theaters so it was directed that these units turn in equipment to depots designated by this office and complete, packed assemblies were shipped from depots to ports. General, Station, Field, and Evacuation hospitals moving indirectly to other theaters turned in their assemblages to depots designated by this office but no specific assemblies were ear-marked for these units, since they were to be called forward by the War Department on Redeployment Shipping Orders. Issue Branch computed requirements of assemblies needed to equip all these hospitals and in conjunction with Stock Control Branch assigned depots to build them. In general, they were assigned to depots which were receiving equipment being turned in. Transfers of stock were then initiated to allow these depots to build the assemblies as completely as possible. During June the Assembly Area Command began to function and stocks to fill Table of Equipment of units, other than hospitals, moving direct, and minimum essential equipment for all hospitals and units moving indirect, were transferred to Depot M-418 (Mourmelon). Equipment for units moving indirectly which was turned in to Depot M-418, or in the case of hospitals - to other depots, was immediately broken down and placed in stock. Redeployment shipping orders were forwarded from the United States calling for shipment of this equipment plus 60 day maintenance for all troops moving to other theaters. These shipping orders were checked for availability of stocks and forwarded to Issue Branch where the shipments were set up. On VJ-Day redeployment of troops was largely converted to movement to the Zone of Interior. This meant that units did not take any equipment out of the theater except minimum essential equipment. Many redeployment shipping orders were cancelled since the units destined for the Pacific were charged to remain in the Zone of Interior and equipment could be furnished there. Outmovement of supplies through the end of September dwindled so that the tonnage of medical supplies in depots increased materially. A few shipments of critical items continued to the Zone of Interior but the tonnage involved was small.

d. Excess and Surplus Stocks

- (1) Declaration of Excesses and Surpluses prior to receipt of TM-38-420

(a) Until the receipt of TM-38-420 in early September, this section was operating under the provisions of SOP 57, dated 1 April 1945. This section was authorized to dispose of only approximately 1,200 of the items on which a theater level was maintained and a few obsolete items which were in theater depot stocks. Declarations were submitted to the GPA for all quantities of these items in excess of theater requirements; however, the value declared was relatively small. Reciprocal Aid items not required to meet the theater requirement or not required for shipment to other theaters, were also declared surplus during this period. Since many British items were not suitable substitutes for like American items and could, therefore, not be shipped to the United States or other theaters, the quantity declared was relatively higher than that of American items.

(b) All items, other than the 1,200 surplus items referred to in above paragraph, were reported monthly to the War Department on two different excess reports. The War Department reviewed the excesses shown thereon and forwarded shipping orders to this theater for the items desired. Excesses were in the process of being disposed of in this manner when VJ-Day arrived and the majority of shipping orders were cancelled.

(2) (Declaration of Excesses and Surpluses after receipt of TM-38-420

(a) Upon receipt of TM-38-420, this office was authorized to dispose of all but 1,600 critical items by surplus declarations to the GPA. These 1,600 critical items were reported monthly to the War Department but could be shipped automatically, thus eliminating the necessity of waiting for shipping orders from the United States. Although TM-38-420 was not received until the early part of September, considerable progress was made in the disposal of excesses and surpluses by the 30th of that month. By that date many of the critical items listed therein had been set up for shipment to the United States and declaration of surplus items was proceeding with all possible speed.

(3) Disposition of Excesses and Surpluses

(a) During the period covered by this history practically no medical supplies were disposed of by the GPA of this headquarters. This was mainly due to the fact that satisfactory financial arrangements for payment by foreign governments had not yet been worked out by government agencies other than the War Department.

(4) Disposition of Hospitals

(a) During the period covered by this history arrangements were made for the turn-over to the French Government of fifty (50) 1,000 bed General Hospitals; to the Belgian Government, eight (8) 1,000 bed General Hospitals; and to the Netherlands Government, three (3) 1,000 bed General Hospitals. By 30 September 1945 eleven (17) hospitals had already been turned over to the French and all hospitals had been turned over to the Belgian and Netherlands Governments. At first difficulty was encountered in the manner of fiscally handling this transaction, but numerous conferences between this office, GPA, and G-4, ironed out these difficulties and reduced paper work to a minimum.

of Medical Supply in Liberated Countries
and the United Kingdom

1. GENERAL

With VE Day, two factors became of increasing importance in the redeployment of supplies and equipment. First, the war with Japan made it necessary to redeploy from the European Theater, a considerable amount of medical supplies. This problem became even more acute when consideration was given to the numerous difficulties encountered in documentation, marking and packing required in the shipment of these supplies. Secondly, the declaration of excesses and surplus in the Theater of Operations required the utmost care in inventory and warehousing of supplies in medical depots. To more completely understand this problem, the mission of medical depots prior to that period, was for the most part, that of supplying combat organizations with medical supplies as need for them arose in their operation. Little stock was declared excess or surplus and few shipments were redeployed out of the Theater. However, with the victory over Germany, more attention and emphasis was placed upon the Redeployment Program. The details of documentation, marking and packing were explained in a manual, "Supply Procedures for Overseas Redeployment #63". But even this manual did not become an operating guide for depots until sometime in July 1945. Consequently, personal calls and inspections were continuously being made upon medical depots on the Continent and the UK, with the purpose of instructing all depot personnel as to the proper methods and procedures involved in the redeployment for overseas shipment of medical supplies.

2. MEDICAL DEPOTS

a. The period, 8 May through 30 September 1945, as applied to Medical Depots and as contrasted to previous periods, was notable for the infrequency of the opening and closing of the Medical Depots. The obstacles and difficulties in the Post VE and VJ periods, however, were numerous and varied. In practically every depot on the Continent, it was observed that packing supplies of all kinds were woefully lacking. As a result, the entire redeployment program was delayed and only by the employment of makeshift methods and the continued effort of the Supply Division in procuring and shipping packing supplies to depots, was the Medical Department able to meet its objectives. Lumber was major item on the list of those in short supply. With little satisfaction by G-4 in the matter of shipment of lumber for packing purposes, it became imperative for the Supply Division of the Medical Department to search for new outlets for lumber in order to meet packing and crating requirements. These same problems and similar ones, could be multiplied in the matter of other items required in the packing of redeployment supplies for overseas shipment.

b. With the advent of VE Day, the entire program and thinking of the ETOUSA essentially became one of ZI operations. The intricacies of ZI operation, however, the education and indoctrination necessary to achieve the objective of the redeployment of supply program, found depots lacking in the fundamental knowledge and standard procedures to bring about the desired results. Faced with these basic problems, and the

necessity of meeting deadlines in the shipping of hospital assemblages from this theater to another, the Office of the Chief Surgeon formulated its plans in conjunction with G-4, and prepared its own procedures. Fundamentally, these procedures were based upon the experience gained thru the years of ZI operations. Previous to the distribution of SPOR (Supply Procedure for Overseas Redeployment), a manual was written and distributed by the Office of the Chief Surgeon, "Documentation, Marking & Packing", dated 14 June 1945 (See exhibit 1). This manual provided depot commanders with a set of instructions in ready reference form which were to be used in the marking and documentation of medical supplies for shipment overseas, either to other theaters or return to the United States. It helped to fill an urgent need for information. Under the direct supervision of the Chief of Depot Technical Control Branch, a representative of the Office of the Chief Surgeon was delegated the responsibilities of instituting the Educational and Training program. The purpose of the Educational program was:

- (1) To indoctrinate depot personnel with procedures on Documentation, Marking and Packing of supplies for Redeployment.
- (2) To serve as a liaison officer between Office of the Chief Surgeon, Depot Technical Control Branch and individual depots on matters pertaining to redeployment supply problems.
- (3) To inspect documents and depot procedures on the efficiency in carry-out of existing manuals on documentation, marking and packing.
- (4) To report results of inspections and recommend revisions to achieve the desired results.

Fortified with the Documentation manual, the Packing & Crating Manual, and other TMs on subjects relating to supply procedures, such as TM 38-413, TM 38-414, depots had information as to the methods to be used, but it was concluded that an educational program should immediately be set in motion to train depot personnel in procedures necessary to effect shipment of supplies and at the same time, prepare documents that would be acceptable to port authorities and the overseas commanders. Supplying troops in the field, many times without any, or little, documentation, and consigning supplies by truck, train and boat to overseas destination, with the necessity for care and attention to detail, demanded a new set of methods and a revised type of thinking. It was to accomplish this that representatives from the Office of the Chief Surgeon called on depots and personally instructed them as to their new responsibilities and the procedures involved. Emphasis was continually being placed on following existing supply manuals and exercising extreme care and accuracy in preparing the required documents.

c. From 2 June 1945 through 11 July 1945, all assembling and distribution depots on the Continent were called upon for indoctrination.

Group meetings of officers and enlisted personnel concerned with supply problems were held. A question and answer period followed each meeting and the initial training was started. It was recognized that a continuous program was necessary. Theater depots were operating with inexperienced personnel, officers and enlisted who had not been faced with depot problems and depot operations. Building a hospital assembly under ideal conditions, required utmost care and supervision. Reassembling such a hospital in the theater required not only personnel trained in such methods, but extraordinary care to pertinent details. One of the major difficulties encountered in depot operations was the frequent turnover of depot personnel, which resulted in a re-educational program continually being necessary. Depot companies would be moved to staging areas, or alerted, to be replaced by units having no depot experience, such as Gas Casualty Companies. This could only result in an accumulation of errors, causing delays at the depot finally shipping the supplies and at the port in checking in shipment.

3. PACKING

With the demands of proper packing and tropicalization required for overseas shipment, it became increasingly evident that a training program be instituted to instruct personnel in proper methods for processing supplies for overseas shipment. The first group of Medical Department personnel to receive this training was instructed during March 1945. The second group of Medical Department personnel to receive such training was instructed through the period 11 May through 16 May 1945. In an effort to standardize processing activities, a detailed packing manual with a breakdown of all classes of medical supply, containing numerous illustrations, was completed and distributed 20 May 1945 to all depots and Base Surgeons, including UK Base, Transportation Corps packing squads, G-4, GPA, and a general distribution made to the Chief Surgeon's Office upon request by the Plans and Training Branch of the Operations Division of the Chief Surgeon's Office (See exhibit 2). Standard Operating Procedure #64, 6 June 1945, from G-4 formally provided for allotments of packing materiel to the various Com Z Sections and that all packing materiel required for redeployment should be requisitioned by the processing depots directly upon the procuring services in their section. In order that a clear understanding of this procedure be had by all depot commanders, a copy was distributed by this office through all Base and Section Surgeons, to Depots M-402, M-407, M-408, M-409, M-413, M-414, M-417, M-418, and M-452. These were mailed 12 June 1945. Because of the short supply of materiel for redeployment packing actually existing on account of delayed action in handling of redeployment requisitions placed on the NYFE, it was decided by G-4 that processing site pipelines could not be filled at the moment and only requisitions for unit assemblies phased for out-movement would be honored. This condition reached such a state that upon request a report of the status of all packing materiel was submitted to Depot Technical Control Branch 21 June 1945. First addition to the Packing Manual was completed and distributed 27 June 1945 (See exhibit 3). On the whole, developments were as earlier

planning had indicated, however, one noticeable miscalculation was in the assumption that all units to be redeployed would have their equipment processed at three designated points on the Continent. Theoretically, this had its advantages, but in actuality the very opposite occurred. It was found necessary principally because of transportation difficulties and in order to meet outphasing dates to have practically every one of the Continental depots engaged in redeployment packing. This necessitated rapid movement and transfer of the very meager packing materials available at the time for distribution.

4. OPTICAL SERVICE

VE Day and the redeployment program that followed imposed two burdens on theater optical services: it caused a scarcity of opticians by reassignment to Pacific bound units, and it brought on a rush of prescriptions for spectacles - most marked "immediate attention" - to optical units ordinarily unprepared for large quantities of work. The ETO Base Optical Shop in Paris, for instance, numbered some twenty-two enlisted opticians on 1 May, and on 1 June, due to redeployment, there were just nine opticians available for duty. Other units suffered accordingly, and to offset the loss in personnel it was decided to train civilians and POWs, whichever were easiest available, for optical work. It was obvious that trained opticians could not be expected of these people, but the plan was made and executed for each individual to learn a particular job in the process of making spectacles and an Army optician given the task of supervising their teaching and inspecting their work. Although this production-line system took more personnel than would normally have been required for the operation, on the whole it was successful. The optical units at the assembly areas caught the brunt of the burden of supplying the redeploying troops with spectacles. Extra equipment and stock was rushed to the units in the Reims area, and the shops in Paris and Liege accepted their overflow, while the Marseille shop was given twice its existing stock level to be certain that the work was not delayed. Although there was a general increase in work for all the shops - Carentan, France; Weinheim and Furth, Germany, and the portable units scattered throughout the theater - the most spectacular figures were from the Reims and Marseille areas where the number of jobs done in July were more than five times those processed in April. For most of the shops the work began to diminish rapidly during August, although in the 3rd Army area huge numbers were still being turned out, and by the time VJ Day was declared, a decided slump was noted everywhere. With the decreasing volume of prescriptions and a lesser proportion of the work being done for the Army, plans began to formulate for a change in the optical picture. At the close of September, equipment was being prepared for either shipment or disposal as surplus property, and arrangements were made for consolidation of optical services and supplies to carry out the optical program for the Army of Occupation.

5. CLOSING OF DEPOT SITES

At the termination of the war in Europe and the beginning of redeployment, a review of the depot sites was made towards determining the

plan and schedule for the closing of depots. Previous to VJ Day, a definite need existed in France for an additional and peculiar type of medical depot to handle units being processed through the Redeployment Assembly Area which was set up in Rheims, France. Some means of receiving and processing equipment and supplies from units coming out of Germany, through the Assembly Areas, and on their way to other theaters, existed. A reconnaissance of the Rheims area revealed no suitable building available for installation of this type; therefore, a new and entirely different type of medical depot was constructed in an open field adjacent to a railroad siding. This depot, which was designated M-418, was located at Mourmelon-le-Petit, 16 miles outside of the city of Rheims. 64,000 sq. ft. of concrete was laid for the eventual consolidation of the depot, for utilization of three portable airplane hangars. These hangars were capable of handling the C-47 type of airplane. In addition, 45,000 sq. ft. of pierced plank landing mat was utilized for outside storage and drive-ways. Transit sheds established to accommodate miscellaneous operations within the depot, such as salvage, unit supply, and so forth. One innovation of this depot was the "sorting circle" designed and set up to facilitate initial sorting of supplies and equipment brought in by trucks. This "sorting circle" was a large circle, some 350 ft. in diameter, and sectioned into wedges - the principle being that as units brought in their equipment and drove the circumference of this circle discharging their equipment in the appropriate wedges within the circle, upon reaching the end of the circle drive, trucks were empty, with equipment in the proper places. From this point, equipment was hauled by trailer trains to the depot proper, where it was broken down and processed and placed in stock for disposition by other means. One of the original intentions within the Assembly Area was to have units being redeployed pack and crate their own T/E. However, experience disclosed that both speed and economy would be effected if this work were done by the depot rather than by individual units. Therefore, the depot was constructed on the premise that units being redeployed would bring their own equipment into M-418 where it could be processed by the medical depot personnel, and within 24 to 48 hours, returned to the unit suitable for export. To accomplish this task, the 16th Medical Depot Co. was assigned to depot M-418. 3,500 ft. of conveyors were set up, pallets were constructed and fork lift trucks obtained. M-418, therefore, became the second 100% mechanical medical depot in the ETO. The basic plan, as designed, went into effect during June 1945, with operations being much more successful than had been anticipated. This depot and two others, M-407, Paris and M-452, Marseilles, were selected to be residual sites, namely, to handle the final outphasing of all medical supplies on the Continent. These depots were charged with the distribution mission in liberated countries in the territories which they served. The other depots, M-402, Carentan, France; M-408, Rheims, France; M-409, Liege, Belgium; M-413, Noirhat, Belgium; M-414, Foug, France and M-417, Elbeuf, France were to be closed as soon as the determination of items for return shipment to the United States and of stock needed for occupational depots and of levels of maintenance stock were decided upon. All other stock was to be shipped to General Disposal Sites selected by the Base Sections and controlled by them as to space allocations. By 1 October, some stock had been declared

surplus and sent to the above-mentioned sites, and inter-depot transfers had been affected and shipments made to the United States, so that the broad phase of closing Continental Depots had begun, although none of these depots had been officially closed by 1 October. (See exhibit 4) In the UK, a similar schedule was determined for the closing of all depots in England, except one, M-424, which was to serve as the distribution depot for final closing activities. Other UK depots, G-35, Bristol; G-23, Histon; and G-20, Burton on Trent, were closed by 30 September, and all stock remaining was transferred to M-424.

HEADQUARTERS
EUROPEAN THEATER OF OPERATIONS
UNITED STATES ARMY
Office of the Chief Surgeon
APO 887

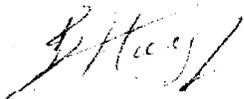

14 June 1945

The enclosed manual has been prepared to provide depot commanders and those concerned with problems and procedures involved in redeployment documentation and marking, with a working guide. The information it contains has been taken from directives issued by the War Department and Com Z.

This manual has been issued in the hope that it may be a self-contained publication embodying those important details on marking, packing and documentation, and therefore, may be used in the daily work of the depot in processing shipments for outmovement.

It is recommended that any question or problem that may arise on these subjects be directed to the Office of the Surgeon, Com Z. This office will serve as a liaison in coordinating and standardizing the activities on depot documentation in regards to redeployment.

FOR THE CHIEF SURGEON:

S. B. HAYS,
Colonel, Medical Corps,
Assistant.

MEDICAL SERVICE, EUROPEAN THEATER OF OPERATIONS

DEPOT INSTRUCTIONS FOR OVERSEA MARKING AND DOCUMENTATION

SECTION I: GENERAL

1. Purpose. The purpose of these instructions is to set forth in ready reference form the methods and procedure to be used in the marking and documentation of medical supplies for shipment overseas, either to other theaters or return to the United States. The basic documents which outline the methods of procedure to be used are as follows:-

- a. POM RED - This document is designed primarily for use by units being redeployed.
- b. SPOR - This document is overall supply procedures concerned with redeployment and is for use of depots and higher headquarters.
- c. TM-38-413 "Theater Shipping Document".
- d. TM-38-414 "Army Marking Directive".

These instructions duplicate to a large extent the material which will be found in the latter three documents and include also explanatory matter and cover special Medical Service problems.

2. Redeployment of Medical Supplies and Equipment.

a. Medical Supplies and Equipment may be -

- (1) organizational equipment, or,
- (2) Bulk stocks.

Organizational equipment may be "force marked" that is, marked for a specific unit with a shipment number, or it may be "bulk shipped", that is, not designated for any specific unit but marked with a shipping designator. Units being redeployed directly to the Pacific Theater will ordinarily be sent with force marked equipment. In the case of all units except those listed below, the units themselves will be responsible for the marking and documentation and actual shipment of their equipment in accordance with POM RED. The following units will be furnished unit assemblies by Medical Depots under instructions from this Office. (See Appendix "v" of POM RED.)

Field Hospital, 400-bed
Station Hospital, all sizes
Convalescent Center, 3000-bed
Convalescent Camp, 1000-bed
Convalescent Hospital, 3000-bed
General Hospital, all sizes
General Hospital, 1000-bed (NP)
Evacuation Hospital, 750-bed
Evacuation Hospital, 400-bed

Medical General Laboratory
Medical Laboratory
General Dispensaries

For the above units, Medical Depots are charged with documentation and marking of the complete assembly, including equipment received from other Services.

b. Depots will be instructed to make overseas shipments by means of shipping orders originated in this Office. These shipping orders will ordinarily be prepared on the theater shipping document form and furnished in four (4) copies so that the depot can utilize the blank spaces as work sheets in preparing the final theater shipping document.

c. Depots will be instructed to manufacture assemblies by this Office. Such instructions will be accompanied by equipment lists prepared on a form similar to the theater shipping document so that these forms may likewise be utilized as work sheets in the depot to prepare the theater shipping document for the assembly. Instructions to ship assemblages, (that is, the shipping order covering the unit assemblage) will be furnished in the form of a letter, teletype, or in an emergency, by telephonic communication.

d. Overseas shipping orders issued by this Office will include complete information as to the overseas marking which will be applied by the depot to all packages. Overseas markings will be placed on packages that are destined for the port only. Overseas markings will not be applied to shipments made from one depot to another within the Theater, even though the shipment is eventually destined for an overseas Theater. It will be the duty of the depot making final shipment to the port in all cases to accomplish final marking and overseas documentation.

e. Assemblages: Medical Department assemblages listed in Appendix "V" of POM RED present special problems and require special handling. The Medical portion of these assemblages will be manufactured in a depot which may or may not be the final depot making the shipment to the port. The depot manufacturing the assemblage, however, will prepare the theater shipping document covering the assemblage utilizing a temporary top sheet. This document will be utilized to carry the assemblage to the depot making final overseas shipment. Depot making final overseas shipment will make up any existing shortages, "marry" the other services equipment, complete the document and replace the temporary top sheet with the final sheet giving correct overseas markings and other essential data. For this reason, Medical Department assemblages will show no items on the top sheet. A "Domestic" (intra-theater) shipping label will be affixed to each box to carry the assembly from one depot to the depot making final overseas shipment.

3. Definitions:

a. Border Number - Numbers appearing around the border of the Theater Shipping Document and which may be used for tallying out shipment.

b. Class of Property - The physical condition of property.

- (1) Class A property - new property.
- (2) Class B property - serviceable, used property.
- (3) Class C property - unserviceable property, the condition of which justifies reclamation and which cannot be repaired locally.

c. Class of Storage or Stowage - Items which because of their nature, value or other peculiarities require separate documentation for their transportation between depots and final ship stowage. (See Depot Information Letter No. 47).

d. Depot Symbol - A two letter symbol assigned for the purpose of designating a specific depot making oversea shipments direct to Ports of Embarkation. EXAMPLE: "PD" (Depot M-407, Paris).

e. ISS Requisition Number - A combination of from one to three letters followed by a number of not more than three digits to be used in the last part of the overseas address. EXAMPLE: A200.

f. Line Item Number - The number of each item on a shipping order (not to be confused with stock number).

g. O. P. - An "Original Package", that is, a package or box containing only one kind of an item. It may be an actual manufacturer's original package, or it may have been repacked by a depot.

h. Shipping Designator - Words of four letters used in an oversea address to represent a specific theater, port or area (EXAMPLE: BOBO).

i. Shipping Order - A directive from the Chief of Service covering the movement of supplies from a consignor to consignee.

j. Separate Shipment - Is a single shipment of equipment and supplies which is made under a single shipping document.

k. Theater Shipping Document - A document listing items that have been prepared for shipment and movement.

l. Transportation Unit - In the shipment of supplies to overseas destinations the whole principle of overseas marking and documentation is that a document is prepared by the shipping depot, which document bears the same markings as those appearing on the packages and which document accompanies the entire shipment to its final overseas destination. The document and the supplies are inseparable. Following this principle, it becomes necessary to break up shipments of supplies into units covered by a document or a set of documents. Such a shipment is a transportation unit. A transportation unit then is a group of supplies covered by a document or, in the case of assemblies, by a set of documents incorporated into one document by the use of an overall top sheet.

R E A D

T H I S

C A R E -

F U L L Y

With the exception of unit assemblies a transportation unit will not exceed fifty (50) tons. Because of the necessity of a unit assemblage moving as a complete unit, a unit assemblage is considered a transportation unit even though it may weigh over two hundred (200) tons. Conversely, on a bulk shipment of supplies not over fifty (50) tons can be shipped on one document. For example, if a shipment of bulk medical supplies amounted to sixty (60) tons this would constitute two (2) transportation units, and it would be necessary to prepare two (2) shipping documents to cover these shipments.

4. The importance of proper marking and documentation of overseas shipments cannot be over-emphasized. Depot commanders are charged with the responsibility that both of these functions are correctly discharged to the last detail. To this end, they will insure that adequate numbers of qualified personnel in their depots are instructed in proper marking and documentation procedure.

SECTION II

MARKING OF SUPPLIES

1. Oversea Marking.

a. To another Theater.

- (1) Force Marked - Shipment Number - (Ordinarily done by the unit except in case of unit assemblies).

Ex: R1234-A-MEDII - SGA10 - SA1 (See Exhibit "B")

The shipment number in this case is "R1234".

- (2) Non-Force Marked - Shipping Designator (Ordinarily done by depot).

Ex: TO: BOBO-L-MEDII - SGB10 - A88 - A272TA1
FROM: IFED (The shipping designator in this case is "BOBO".)

(See Exhibits "C", "D", "E")

b. To United States

- (1) Non-Force Marked Only. (Ordinarily done by depot)

Ex: USA-L-MEDII - A78 - A278SL1 (See Exhibit "F")

2. Intra-Theater Shipments - Covered by Theater Shipping Documents and destined for reshipment overseas.

- a. A domestic address shipping label placed on container (no oversea address) (See Exhibit "A").

3. Box Markings.

- a. At least one surface of container will be free of all markings except colored triangles (service color) when it arrives overseas.

b. Old addresses, labels and other markings no longer required will be obliterated. On organizational equipment, force marked, and shipped by the organizations themselves, color triangle corners will be obliterated. Hospital and similar unit assemblages shipped to ports by Medical Depots will have maroon corners on all packages including the equipment furnished by other Services. Only the following markings will be left:

- (1) Weight
(2) Cube
(3) Item Number

- (4) Nomenclature
- (5) Quantity
- (6) Set Number
- (7) Expiration date of contents when applicable.
- (8) Lot numbers of drugs (if shown by manufacturer).
- (9) Descriptive information on technical equipment.
- (10) Instructions on storage where they appear, i.e. "This End Up", Etc.

c. Periods will not be used with abbreviations (Ex: PK, BL, PKG, BX).

d. Mixed Boxes. Each box with mixed contents will be stenciled with information as to principal items therein or general nature of contents.

Medical Supplies will be classified as follows:

Drugs - (Also includes narcotics, alcohol, and whiskey but entered on separate Theater Shipping Document from ordinary drugs.)

Biologicals.

Books.

Dressings.

Spare Parts.

Surgical Instruments.

Laboratory Supplies.

Dental Supplies.

X-Ray Supplies.

Hospital Supplies.

Veterinary Supplies.

Medical Field Equipment.

e. Each package will be marked with the letter indicating class of property (Class "A", "B" or "C"). Such letter will be in black, approximately 2 inches in height and placed immediately below the content information. (See DEFINITIONS), (Also Exhibit "C").

f. On "OP's" the item number, nomenclature, unit and quantity will be shown.

g. When the container is 10 cubic feet or under, information as to contents will be stenciled on one surface of container, preferably where size of container permits, on one side (Exhibit "B"). When the container is over ten (10) cubic feet, such information will appear on two surfaces, i.e., on one end and one side. (Exhibit "C")

h. The weight and cubage of container will be marked on each container. The abbreviation "WT" and "CU" are the only abbreviations authorized.

- (1) Gross weight of each package will be shown to nearest pound, and cubage to nearest cubic foot; except small containers which will be shown to the nearest tenth of cubic foot.

i. The Package Number.

- (1) The approved abbreviation "PKG" will be used with the individual package number assigned to the container following immediately thereafter, ex: PKG 80. (Exhibit A, B, C, D, E, F)
- (2) The word "package" as used is meant to include boxes, bales, barrels, bundles, cartons, crates, chests, cases, parcels, packets.
- (3) The package number will usually appear on the side of the box under contents on one side with overseas address. (See Exhibit A, B, C, D, E, F).

j. Service Color Markings (corner triangles).

- (1) Medical Department Maroon - Identification Paint will be used in marking for identification of containers. (Same as sample furnished depots).

~~NOTE: Organizational equipment carries no Service Color Markings. See for 36 items~~

- (2) This specific color will be painted on each of two diagonally opposite corners.
- (3) Where size or shape of container is such that stenciling is not practical and tags are used, the color will appear on the corner of the tag and will be daubed on the item in close proximity to the overseas address.

k. The Cadeuseus.

- (1) The Cadeuseus will appear on all Medical Department containers in Medical Maroon. It will be shown on upper right hand corner of surface on which the overseas address is stenciled and on one end in lower right hand corner between cleats (Exhibits A, B, C, and D). Where size of container permits, the cadeuseus will be approximately 8 inches in height.

l. Set Markings.

- (1) When a "set" is placed in two or more containers, the component parts must be shipped together. In such cases whether shipped by depot or by an organization, each container will bear, in addition to its own number within the set, the total number of containers making up set, and the number of the set within each shipment. This information will appear in lower left hand corner of the side showing overseas address (see Exhibit C).

Ex: SET I 1/3

- (2) A two (2) inch maroon disc will be placed above the set number on each container signifying that all items of shipment be shipped together.
- (3) In the event sets are received from the U. S. bearing the markings, "Part 1 of 3 parts, etc", the markings will not be obliterated. However, (1) and (2) above will be shown in addition to other markings denoting container to be a part of a set (Exhibit C).
- (4) Set markings are not applicable to assemblages as a whole. However, set markings will be used on components of hospital assemblages such as X-Ray equipment.

m. Assembly Numbers.

- (1) In addition to all other prescribed markings, unit assemblies will be assigned special markings for purpose of numbering each assembly. This will be included in the oversea address (consignee combination). However, in shipment of a unit assembly to another depot, the unit assembly number will be added to the domestic label, and will ~~be~~^{also} be stenciled on the box. (See Exhibit A).

n. Certain items while coming under the classification of General Cargo require special handling, but are not to be separated. The following examples illustrate method of control.

- (1) FRAGILE. Containers packed with items which, due to fragile composition, require special care in handling will be appropriately marked "FRAGILE" on at least 3 surfaces in location which will not obstruct or interfere with other authorized markings.
- (2) THIS SIDE UP. When containers are marked with the phrase "This Side Up", to prevent damage in transit, arrows indicating the top of the container or the item, will be placed on the sides, pointing to the top.
- (3) X-ray Film, biologicals and any other drugs and chemicals having an expiration date, will have the earliest expiration date stenciled on all overseas shipments as part of the contents description.
- (4) Packages containing acetate base films, photographic chemicals or photographic paper, in addition to regular marking identification, will be stenciled "Non-Inflammable" in black or blue letters not less than one (1) inch in height, preferably in the vicinity of description of the contents.

o. The Overseas Address. Depot making shipment to ports of embarkation will stencil all packages with oversea markings as outlined in Depot Information Letter No. 40.

- (1) On all overseas shipments the overseas address will appear on all containers. Such addresses will be clear and placed in a conspicuous manner on the container. (See Exhibits A, B, C, D, and E).
- (2) When the container is 10 cubic feet and under, only one side need be marked with an oversea address. When over 10 cubic feet, the oversea address will appear on 2 surfaces of the container. (Exhibit C). If the surface area does not permit placing the oversea address all on one line, a break will be made only where a dash (spacer) occurs (Exhibit D).

p. Use of "Domestic Labels". Domestic labels are used to carry shipments to ports or to other depots in the theater. If shipments to ports are made in transportation under control of depot or

port, domestic labels are not needed.

- (1) Labels will be securely attached to the containers and covered with a waterproof, transparent protective coating.
- (2) When the size of the container makes it impractical to use a label, waterproof tags securely fastened to the container and bearing the same information as the container, may be used.

SECTION III: DOCUMENTATION:

1. There are basically two (2) documents used in the preparation of shipments of medical supplies to Ports of Embarkation.

- a. Theater Shipping Order, or an Equipment List.
- b. Theater Shipping Document.

2. The Chief Surgeon, Com Z, will send an equipment list or a Theater Shipping Order to the depot to be used in assembling a shipment, or preparing a bulk shipment for outmovement.

3. Upon receipt of notification to assemble supplies for shipment, the depot commander will process the shipping order or applicable equipment list. Such processing will include stock availability check, preparation of a shortage report, selecting of stock, packing and marking.

4. As soon as processing of shipment has been completed all data from the shipping order or applicable equipment list will be transcribed to the Theater Shipping Document Stencil and reproduced. Fourteen (14) copies are required for bulk shipments and fifteen (15) copies for assemblies. Two (2) extra copies are required for all mixed boxes.

5. Procedure with Assemblages. The depot manufacturing the assembly will retain copy No. 15 for its files and hold the shipment and 14 copies for shipment to the depot which is to make final shipment to port.

6. The depot making final shipment to the port upon receipt of assembly and documents, will take such action as may be necessary to complete existing shortages, if any; to finalize documentation including the preparation of new top sheets showing overseas address and make distribution as follows:

- a. One (1) copy for depot's file.
- b. One (1) copy, to be used as a master packing list for information of consignee, will be placed in Box 1. Statement to this effect will be written on cover sheet.
- c. One (1) copy, to be used as a master packing list for information of consignee, will be placed in Box 50. Statement to this effect will be written on cover sheet.
- d. One (1) copy will be sent to Chief Surgeon.
- e. One (1) copy will be sent to Chief of Transportation.
- f. Nine (9) copies will be sent to Commanding Officer, Port of Embarkation.
- g. (Two extra copies will be reproduced to be used in shipments of mixed boxes.)

EX:

QUANTITY TO BE
SHIPPED
300
58

18. THE RECAPITULATION OF SHIPMENT is used to receive, assemble and load cargo. The total cube and weight data are required for cargo planning purposes. The description contained in the Recapitulation of Shipment is copied exactly onto the ship's manifest and is used at ports of debarkation for unloading the vessel and as a basis for the distribution of supplies to depots or troops.

EX:

RECAPITULATION SHIPMENT					
TOTAL	TYPE	PKG	DESCRIPTION	WEIGHT	CUBE
6	BX		BURNER, BUNSEN	600	18
			4-BURNER		
10	BX		BURNER, BLAST	915	10
			CLASS "A"		
16	TOTAL		TOTAL	1515	28

19. TOTAL PACKAGES. For each entry the total number of packages will be shown.

20. TYPE PACKAGE. The nature of the shipping container used will be shown. If the individual listing under the description involves more than one type of package, the entry for each type of package used will be repeated.

21. DESCRIPTION.

a. Enter summary of shipment contents. This summary should neither repeat all the details in the body of the document nor describe the shipment in such broad terms as to make the information valueless.

- (1) When only a few items are involved, abbreviated nomenclature of each item may be used.
- (2) Items which constitute a normal group may be consolidated under a single entry. This is particularly applicable to various items of Medical Department Issue (EXAMPLE: X-ray equipment), or parts pertaining to major items (EXAMPLE: Parts, Boiler Steam).
- (3) When items covered by shipping documents are too numerous for listing groupings will be shown - (EXAMPLE: Surgical Instruments, Veterinary Supplies, etc.). Broad descriptive terms, such as "medical supplies" will not be used unless unavoidable. Where practicable, major technical items should be listed separately.

b. CLASS OF PROPERTY WILL BE ENTERED ALONG BOTTOM OF THIS SPACE (Except in the case of assemblies) (EXAMPLE: Class "A"). Remember on bulk shipments, separate documents are required for Class A, B & C supplies.

22. TOTAL WEIGHT. (The total weight to the nearest pound of all packages for each entry under description and type of package will be shown.

23. TOTAL CUBE. The total cube of all packages for each entry under description and type of package will be shown.

24. TOTALS. The totals of packages, weight and cube of entire shipment will be entered. On unit assemblies, total packages by type, total weight and cube by type of package for each class of cargo in the entire assembly will be shown on the cover sheet recapitulation with grand totals.

25. CLASS OF STORAGE AND STOWAGE. Enter here in CAPITAL LETTERS the class of storage and stowage. Use only the classes listed in Approved List. Separate documents are required for each class of storage and stowage. In unit assemblies the various documents for each stowage class are made into one overall document by the use of a master top sheet, in which case enter "Unit Assemblies" in this space.

EX: _____

SECTION IV

SUGGESTED DEPOT PROCEDURE IN PREPARATION OF
ASSEMBLIES AND OTHER OVERSEAS SHIPMENTS

1. Bulk Shipments.

a. Shipping orders sent out by the Chief Surgeon will have been broken down into separate shipments. However, depots prior to taking any action should check these shipping orders to make sure that each shipping order does in fact call for only one separate shipment.

- (1) Less than 50 long tons.
- (2) Addressed to one consignee.
- (3) Only one class of property "A", "B" or "C". Unless otherwise designated, Class "A" property is to be shipped. If necessary to ship Class "B" property, it will be necessary for the depot to prepare a separate document covering such shipment.
- (4) Only one Class of Stowage. Depots will annotate their stock record cards for all items other than general stowage items (See Depot Information Letter No. 47).

b. Shipping orders will be furnished to the depot in four (4) copies utilizing the same form as theater shipping document which is to be prepared in the depot. These copies may be used by the depot as work sheets to fill in all required information in the warehouse, loose stock room, and the shipping floor, making it unnecessary to prepare any other work sheets in the depot.

c. After processing shipping order through the stock record section for stock availability check, shortages will be extracted to the Chief Surgeon in accordance with instructions on the shipping order.

d. It is suggested that shipping order be processed through the warehouse first, then through the loose stock room.

e. Each warehouse OP is to be given a package number. The usual allowance for increasing or decreasing of quantities to meet OP's will be followed in order to avoid mixed boxes insofar as possible.

f. In the preparation of the mimeographed stencils for the shipping document, items will be entered in box number sequence

insofar as possible, rather than item number sequence. Itemized listing will begin on a "continuation sheet" which will be numbered "Sheet No. 2" and as many continuation sheets will be used as are necessary, numbering each sheet consecutively. Generally speaking OP's should be listed first. In documenting mixed boxes one or more continuation sheets as may be necessary will be utilized to list the contents of each box. In beginning a new box, begin on a new continuation sheet. It is important that not more than one mixed box appear on any one sheet. In packing mixed boxes the information regarding number of packages, type of package, package number, weight and cube will appear only once (on the same line as the first item listed). However, if it is necessary to use more than one sheet for a mixed box, the package number will appear on the first line of each sheet. It is suggested that a typist be physically located in close proximity to the packers in the loose stock room so that stencil can be cut as soon as the box is packed. As soon as the stencil is cut 17 copies will be run off; one copy being placed inside the box to serve as a packing list and another copy placed in a waterproof envelop outside of the box and covered by a "cover plate" if available. As soon as the packing list is placed inside the box the lid can be nailed on and the box strapped. Packer will mark on the box the box number as recorded by the typist on the document.

NOTE: Mixed boxes containing items of a security nature should have a detailed packing list placed inside of box. A packing list of the box, giving only sufficient reference to the package number to identify it, will be securely fastened to the outside of package.

g. In those cases where an item is shipped partly in OP's and partly in a mixed box, it is necessary that the item appear at least twice on the document, once for the OP listing and again in the mixed box. The practice as utilized by some ZI depots in splitting a line and showing part of the quantities in OP's and part in a mixed box will not be used in this theater. The samples of "continuation sheets" showing the listing of OP's appears in Exhibit G (2). Sample of "continuation sheet" showing mixed box appears as Exhibit G(3).

h. The top sheet will be prepared last. No itemized listing will appear on the top sheet. Exception: If all the items called for in the shipment can be entered in the 9 lines available on the top sheet then the whole document will be placed on the top sheet and no "continuation" sheets will be required. In ordinary shipments where "continuation" sheets are required and where no item listing appears on the top sheet, any pertinent information necessary for the shipment will be entered on the top sheet.

Example: "This shipment comprises 5 sheets, itemized listing of which appears on the following continuation sheets. A copy of this docu-

ment will be found in box No. 1 and in Box No. 50 (if more than 50 boxes are needed) of this shipment."

i. Distribution of Copies: On bulk shipments 14 copies of the document are required (16 copies of those continuation sheets which apply to mixed boxes so that one copy can be placed inside the mixed box and another on the outside of the mixed box to serve as a packing list). Each copy of the completed document is marked in red pencil "Copy No. ____". Copies 1 through 9 will be sent to the port. Copy No. 11 is sent to the Office of the Chief of Transportation, APO 887; Copy No. 10 is sent to the Office of the Chief Surgeon, APO 887; Copy No. 12 is retained by the depot; Copy No. 13 is placed in Box No. 1 and Copy No. 14 is placed in Box No. 50.

2. Assemblies.

a. Ordinarily the medical components of assemblies will be assembled in one depot, documented and then shipped to another depot near the port for marrying with other Services' equipment and making up of final shortages, and final documentation.

b. The Chief Surgeon will furnish the assembling depot with copies of equipment lists similar in design to the theater shipping document. These can be utilized in the same manner as shipping order for bulk shipments and used for work sheets in the warehouse and loose stock room.

c. A hospital or similar unit assemblage is considered to be a single transportation unit even though it does consist of several classes of stowage and may have Class "A" and "B" property in it. The assembling depot will assign a voucher number to the assembly with sub-voucher numbers for each class of stowage. It is not necessary to assign sub-voucher numbers for Class "B" property.

Example: PB4675-1, PB4675-2, etc.

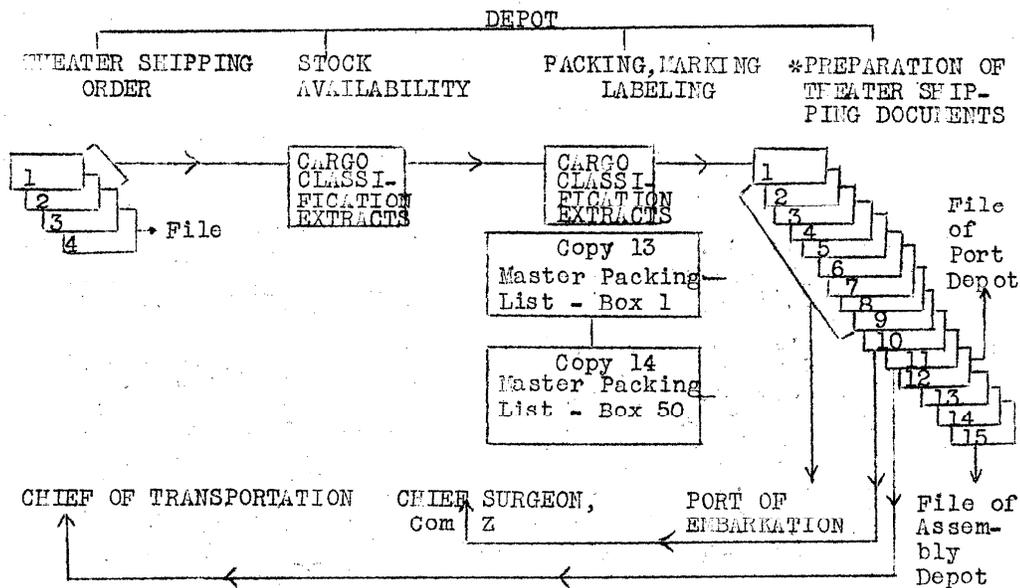

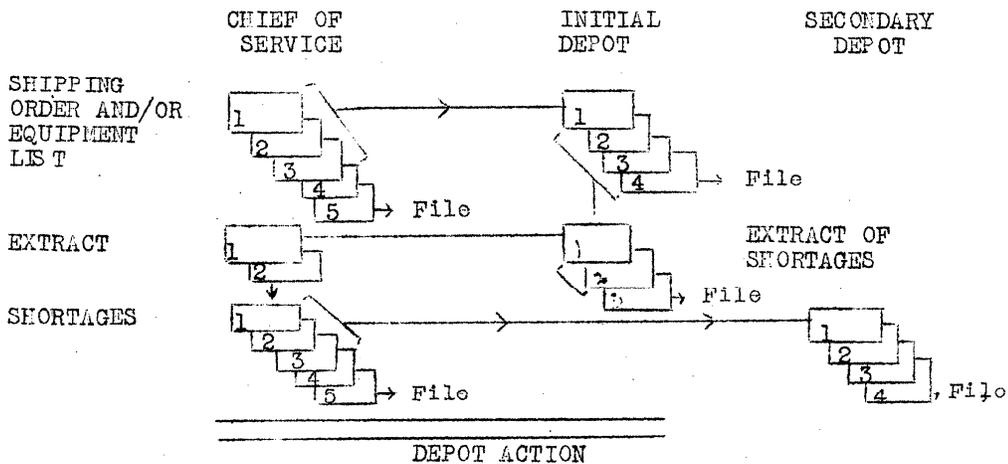

Each sub-voucher will be processed through the depot separately and will be documented separately with a top sheet. The documents covering the entire assembly, that is all of the sub-voucher documents, will be bound together and covered by a master top sheet. Examples of master top sheet and sub-top sheet are shown in Exhibits H(2) and H(3). Ordinarily at the time instructions are issued to manufacture an assembly, oversea markings will not be known. For this reason it is necessary to prepare a temporary master top sheet which is utilized to carry the assembly to the depot near the port, where upon completion of shortages and marrying of other Services' equipment and upon receipt of overseas shipping instructions a new master top sheet will be prepared to replace the temporary master top sheet. (See Exhibit H (1)).

d. Distribution of copies of document: Instead of the 14 copies required for bulk shipments, 15 copies are required for assemblies, copy No. 15 to be retained by the depot making the assembly. Space is left in boxes No. 1 and No. 50 to place copies No. 13 and No. 14. However, these will not be placed in the boxes by the assembling depot. At the time the assembly is forwarded to the depot near the port, 14 copies of the document as prepared by the assembling depot will be transmitted to the receiving depot under custody of the guard accompanying the assembly who will deliver them to the depot commander of the receiving depot.

3. Shipping of shortages: In shipping shortages for an assembly or for a bulk shipment from a depot supplying these shortages, or to a port depot which is preparing shipment for outmovement, no theater shipping documents are required.

FLOW OF A THEATER SHIPPING ORDER AND A
THEATER SHIPPING DOCUMENT

CHIEF SURGEON, COM Z, ACTION

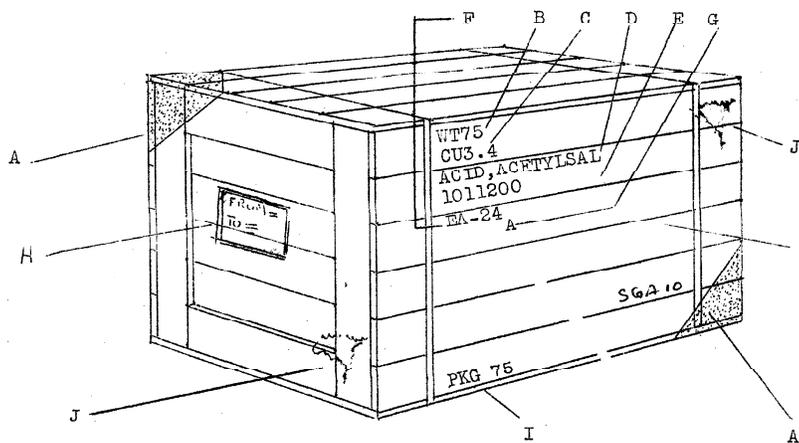

*Note: On mixed boxes copies of 16 & 17 are run off to serve as packing lists.
On Assemblies an extra copy is required to be retained by Assembling Depot. APPENDIX A

N O T E

The following exhibits of marked boxes illustrate the box markings which should be stenciled on all boxes and packages.

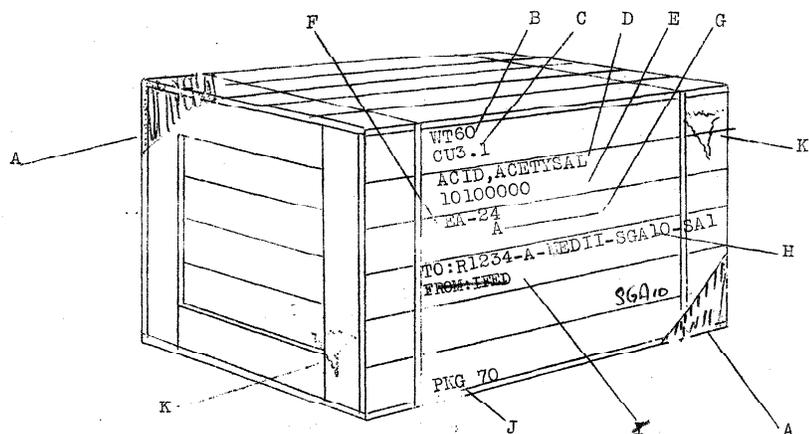

However, if stenciled markings of contents are already on the ends, rather than on the sides as illustrated, such containers may be shipped without any additional markings on the side. The exceptions being those boxes over ten (10) cubic feet which require stencil markings on both end and side.

DOMESTIC CONTAINER - SHIPPING LABEL

THE PREPARATION OF MEDICAL SUPPLIES
FOR
OVERSEAS SHIPMENT

*Exhibits 243
Section III*

PREPARED BY: OFFICE OF THE CHIEF SURGEON
HEADQUARTERS ETOUSA
A. P. O. 887, U. S. ARMY

HEADQUARTERS
EUROPEAN THEATER OF OPERATIONS
UNITED STATES ARMY
Office of the Chief Surgeon
APO 887

1 May 1945

The purpose of this manual is to provide a "guide" as to required packing standards for "tropicalized" packs. Medical supplies packed for storage and use in tropical theaters are required to withstand unusually destructive forces of nature. Unless standards are maintained which provide sufficient protection, heavy losses are certain to result. The standards presented are intended to eliminate such losses.

This manual was constructed under emergency conditions and does not treat all Medical Department Items. But a manual of any nature if used properly can only stimulate the thinking of the ones who will do the actual work. There is and never will be any substitute for good practical "common sense".

The tables showing procedures to follow for certain specific items are intended as examples for convenient reference and application as indicated for similar items. The information contained herein has been compiled by the Office of the Chief Surgeon and embodies the very latest techniques and ideas for completing a satisfactory "tropicalized" pack. It is hoped that the packing principles recommended will be emulated in the thinking and operation of every depot packing for overseas shipment.

FOR THE CHIEF SURGEON:

S. B. HAYS,
Colonel, Medical Corps,
Assistant.

TABLE OF CONTENTS

PART A

CLASSES 1 THROUGH 9 MEDICAL SUPPLIES

Class 1 Medical Supplies -----	1
Items Requiring Special Labels (Class 1) -----	2
Quantity of Class 1 Items per Original (Re-Pack) Container-----	3/12
Class 2 Medical Supplies -----	13

PART D

MAINTENANCE

Maintenance -----	155
-------------------	-----

PART A

CLASS 1, 2, 3, 4, 5, 6, 7, 8, and 9 MEDICAL SUPPLIES

CLASS 1 MEDICAL SUPPLIES:

Class 1 items require protection against (1) BREAKAGE, (2) CRUSHING.

All original packs should be carefully examined for leakage or looseness and to determine if liner within box is adequate as a water-proof barrier.

When repacking is found necessary, limit all box weights to 70 pounds or less and box size to 4 cubic feet or less.

Packing materials required: Single-faced corrugated in 6", 9" and 12" widths, Double-faced corrugated sheets, Kraft wrapping paper, Twine, Kraft gummed tape in 2" widths, Cellulose wadding, Mineral materials for acids (asbestos, rock wool or ashes), Excelsior.

(Refer to page 114/116 for individual unit wraps, Pinch Pack, etc.)

Tighten all bottle caps; pack tightly without any glass-to-glass contact. Use single-faced corrugated for individual bottle wraps and excelsior as additional cushioning material. All dunnage material to be inclosed within waterproof liner. Every waterproof liner to have one layer of double-faced corrugated at top and bottom, front, back and both sides of all packs before being sealed. (All bottles weighing over 5 pounds and cans weighing over 10 lbs should have two layers of double-faced corrugated top and bottom of pack).

Fiberboard boxes must be overpacked by waterproof liner and nailed wood box or repacked before shipment if proper size for overpacking is not available.

Packers must in all cases make sure that the lid of box, when nailed, fits snugly against top of bag so that there can be no movement during rough handling and shipment.

In the case of alcohol and narcotics, the markings on box should show item No., general description only as "Drugs", "Medical Supplies" or "Dental Supplies". The same rule applies where packing lists are necessary in regard to alcohol and narcotics.

Intravenous Fluids: Always protect dextrose and other intravenous fluids by pinching about the neck a narrow strip of

corrugated material and allowing it to extend $\frac{1}{4}$ " to $\frac{1}{2}$ " above it and then wrap with cellulose wadding. This should be overwrapped then with single-faced corrugated before packing in box.

CLASS I

ITEMS REQUIRING SPECIAL LABELS

ON EXTERIOR CONTAINER

(Information Only - Pending decision by the War Department labels will not be used for shipments to other theaters or for return of medical supplies to the Z I.)

ITEMS REQUIRING	BLACK on WHITE "ACID" LABEL	ON CONTAINER
1007000	Acid, acetic, glacial, 1 lb USP *	
1008000	Acid, acetic, glacial, 5 lb USP *	
1015500	Acid, formic, $\frac{1}{4}$ lb ACS *	
1016000	Acid, hydrochloric, 1 lb ACS 38% *	
1015700	Acid, hydrobromic, $\frac{1}{4}$ lb purified 34% *	
1017000	Acid, hydrochloric, 6 lb technical 32% *	
1020000	Acid, nitric, 1 lb ACS *	
1026000	Acid, phosphoric, 1 lb ACS *	
1034000	Acid, sulfuric, 1 lb ACS *	
1036000	Acid, sulfuric 5 gal. commercial *	
1037000	Acid, sulfuric, aromatic $\frac{1}{4}$ lb USP *	
1038000	Acid, sulfuric, fuming 1 lb Reagent (Oloum) *	
1039000	Acid, sulfurous, 1 lb ACS *	
1041800	Acid, trichloroacetic, 1/5 lb Reagent	
1042000	Acid, trichloroacetic, 1 oz USP	

* See Special Instructions for handling of acids, Page 109.

ITEMS REQUIRING	BLACK on WHITE "CORROSIVE" LABEL	ON CONTAINER
1108000	Bromine, 1 oz ACS	
1159000	Cresol, saponated solution 1 quart	
1160000	Cresol, saponated solution 5 gal.	
1235000	Iodine, $\frac{1}{4}$ lb USP	

ITEMS REQUIRING	BLACK ON WHITE "CORROSIVE LABEL	ON CONTAINER
1339000	Phenol 1 lb USP	
1366000	Potassium hydroxide $\frac{1}{4}$ lb USP	
1434000	Sodium hydroxide $\frac{1}{4}$ lb USP	

ITEMS REQUIRING BLACK on RED "INFLAMABLE LIQUID" LABEL ON CONTAINER

1003000 Acetone, 1 lb ACS
1004000 Acetone, 5 lb ACS
1048000, 1049000, 1049500, 1049700, 1049900, 1050000, 1051000, 1052000,
1052500 Alcohol
1098600 Benzene, $\frac{1}{4}$ lb ACS (Benzol)
1126000 Carbon Disulfide, 1 lb ACS
1150000 Colloclon 1 oz USP
1179000 Ether, for anesthesia, $\frac{1}{4}$ lb
1179300 Ether, petroleum, 1 lb
1180000 Ethyl, chloride, 3 oz USP
1220000 Glyceryl trinitrate, 10-1/10 gr Hypo tablet USP
1285000 Methanol 1 lb ACS
1322000 Oil, turpentine, 1 qrt USP

ITEMS REQUIRING BLACK on YELLOW "OXIDIZING MATERIAL" LABEL ON CONTAINER

1027800 Acid, picric, 5 gm Reagent, (Trinitrophenol)
1028000 Acid, picric, 1 oz USP (Trinitrophenol)
1360000 Potassium chlorate 1 lb NF EXPLOSIVE OR CONCUSSION
1372000 Potassium permanganate 1 lb USP
1372200 Potassium permanganate 5 lb USP
1436000 Sodium nitrate $\frac{1}{4}$ lb ACS
1437000 Sodium nitrate 1 oz ACS

ITEMS REQUIRING RED on WHITE "POISON" LABEL ON CONTAINER

1431000 Sodium cyanide, $\frac{1}{4}$ lb ACS

QUANTITY OF CLASS I MEDICAL DEPARTMENT ITEMS TO
BE PACKED IN AN ORIGINAL (RE-PACK) CONTAINER.

A - LIMITING FACTORS: WEIGHT - 70 Lbs
SIZE - 4 Cu Ft

AB - PACK IN MULTIPLES OF 12 (SIZE PERMITTING) PLUS
"A". IF SIZE DOES NOT PERMIT, PACK IN MULTIPLES
OF 2-3-4 or 6.

CLASS 2 MEDICAL SUPPLIES.

Class 2 Medical Supplies consist of surgical dressings, gauzes, bandages and adhesive pla. sters. Because so many of these items are required to be absorptive as well as sterile at time of use, it is vital that the packing guarantee protection during shipment and subsequent storage, no matter how tropical the climate.

All items must be protected by a waterproof liner and packed in a wood box, properly nailed, strapped and stapled.

Items in original V-board containers may require overcrating in order to prevent crushing and breaking of carton. Repacking of some may be unavoidable if for example liner is inadequate. It may be found possible to overwrap with waterproof paper and then crate to protect the liner but generally repacking would be the simplest method in cases of this sort.

Most all class 2 items are lightweight so the principal limiting factor is the size of containers - not to exceed 4 cubic feet.

QUANTITY OF CLASS 2 MEDICAL DEPARTMENT ITEMS TO
BE PACKED IN AN ORIGINAL (RE-PACK) CONTAINER.

CLASS 3 MEDICAL SUPPLIES.

1. Class 3 Medical Supplies consist of surgical instruments, surgical appliances, diagnostic instruments and surgical supplies. A logical division of these items for simplification of packing procedure is suggested by the fact that some Class 3 items require processing and others do not. For convenience of reference, Class 3 Supplies are separated into two groups as follows:

Items requiring processing.

Surgical instruments of simple design such as forceps, hemostats, scissors, knives and curettes.

Surgical instruments of complex design such as retinoscopes, anesthesia apparatus, cautery transformer and cardiographs.

Items not requiring processing.

Surgical supplies such as splints, gloves, crutches and arch supports.

* Surgical instruments of simple design must be thoroughly cleaned and dried, (two successive Stoddard Solvent tanks - compressed air dry - Methanol dip - compressed air dry - oven dry) treated with a proper preservative, wrapped in Grade "A" material or aluminum foil and packaged in a laminated foil or cellulose envelope which is heat-sealed. Prior to sealing of envelope insert identification labels showing item number and nomenclature. It is also possible in some instances to package in "C" cloth and dip and overwrap with kraft paper.

Surgical instruments of complex design must be superficially cleaned of all finger marks or other "dirt" before packaging and in nearly all instances a desiccant should be inclosed within a moisture-vaporproof barrier.

Some supplies do not require processing but because of deterioration or contamination due to fungi, mold or insect attack, must be adequately packaged in a method IA wrap (moisture-vaporproof laminated foil barrier or "C" wrap and dip - no desiccant used in IA packaging) before inclosure within waterproof liner within nailed wood box.

2. All items must be protected by waterproof liners.

3. Dismantling and packing of the following items should not be attempted without assistance from the maintenance section of the processing center:

3604000 - Anesthesia Apparatus
3609006-20 - Anesthesia & Suction Apparatus
3613006-8-15-16 - Audiometers

* (Unit packaging method - Pages 16, 17 and 18)

3624506-1C - Cabinet, Specialists
 3625008-3626000 - Cardiographs
 3864208-14 - Tent, oxygen

TABLE I

(Note - Where "C" cloth or A-51 or other foil barrier is optional, in Column 6 of following table, always use "C" cloth whenever package is small enough for wax dip - For all oil and compound coatings excepting AXS-673, use Grade "A" wrapping to hold coating in place.)

CLASS 4 MEDICAL SUPPLIES.

1. Class 4 Medical Supplies consist of laboratory equipment and laboratory items. These may be further classified into two separate groups as follows:

Glass and Fragile Items.

Examples of this group are bottles, beakers, test-tubes, laboratory dishes, cylinders, pipettes and funnels.

Technical Equipment of a Metallic Nature.

Examples of this group of Class 4 supplies are centrifuge, electric, microscopes, shaking apparatus and scales.

The large group of glass and fragile items requires the same careful and specialized packing treatment necessary for Class I glass items. As in Class I, all outside shipping containers must be nailed wood boxes, conforming with specifications.

The metallic items generally require processing as a preventive measure against corrosion in addition to packing.

2. Dismantling and packing of the following items should not be attempted without assistance from the maintenance section of the processing center:

- 4020006-12 - Basal metabolism apparatus
- 4402005-4403028 - Sterilizers
- 4011013-35 - Autoclaves.

TABLE II

(Note - Where "C" Cloth or A-51 or other foil barrier is optional, in column 6 of following table, always use "C" Cloth whenever package is small enough for wax dip - For all oil compound coatings excepting AXS-675, use Grade "A" wrapping to hold coating in place.)

ITEM	DESCRIPTION	PROCESSING METHOD TO EMPLOY				
		CLEAN (Wipe or Dip)	PRESER- VATIVE (Oil or Compound)	UNIT PACK- AGING METHOD	UNIT PACK- AGING MATERIAL	DESICCANT (For 2 year Period)
4001000	Adapter, curved			Wrap Kimpack carefully around the curved end and make a pinch pack.		
4002000	Adapter			Wrap multiples of 2 or 4 in pinch pack.		

ITEM	DESCRIPTION	PROCESSING METHOD TO EMPLOY				
		CLEAN (Wipe or Dip)	PRESER- VATIVE (Oil or Compound)	UNIT PACK- AGING METHOD	UNIT PACK- AGING MATERIAL	DESICCANT (For 2 year Period)
4016000	Balance	Wrap about 4 units in ordinary wrapping paper and bind package with tape so as to form solid pack and prevent chipping.				
4017200	Balance, Harvard	Wipe	None	II	"C" Cloth or A-51	Yes
4020008	Basal Metab.	Wipe	USA 2-k20	II	"C" Cloth or A-51	Yes
4033000	Beaker	One beaker per open roll pack.				
4056700	Bottle (wide mouth)	One bottle per open roll pack.				
4067000	Bottle (narrow neck)	One bottle per combination pack.				
4055000	Bottle (1 gal)	Wrap Kimpack around neck of bottle and use excelsior pad method.				
4093000	Brush	Wrap in Kraft paper before packing.				
4101000	Burette	Special Instructions - see page 34				
4103000	Burner, bunsen	Wrap in kraft paper before packing.				
4129300	Centrifuge, Elec	Wipe	USA 2-120	II	"C" Cloth or A-51	Yes
		See Special Instructions - page 34				
4139008	Centrifuge, Elec	Wipe	USA 2-120	II	"C" Cloth or A-51	Yes
4184000	Colorimeter	Wipe	None	II	"C" Cloth or A-51	Yes
4187000	Condensor	Special Instructions - see page 34				
4241000	Flask, dist.	Wrap Kimpack around the neck and narrow extending spout and hold in position with tape. Then wrap entire object in single-faced corrugated and make a pinch pack.				
4263000	Funnel	Build up cylinder, flask or funnel to the base by means of an excelsior pad. Use open roll or pinch pack whichever is most suitable.				

ITEM	DESCRIPTION	PROCESSING METHOD TO EMPLOY				
		CLEAN (Wipe or Dip)	PRESER- VATIVE (Oil or Compound)	UNIT PACK- AGING METHOD	UNIT PACK- AGING MATERIAL	DESICCANT (For 2 year Period)
4277000	Hemacytometer	No	None	I-A	"C" Cloth or A-51	None
42812 00	Hemoglobinamet	No	None	I-A	"C" Cloth or A-51	None

4327300	Microscope, dis. (Refer to page 109)	Wipe	None	II	"C" Cloth or A-51	Yes
4327500	Microscope, lamp (Refer to page 109)	Wipe	None	II	"C" Cloth or A-51	Yes
4336000	Microtome	Wipe	None	II	"C" Cloth or A-51	Yes
4337000	Microtome, clin.	Wipe	None	II	"C" Cloth or A-51	Yes
4339000	Micro. Knife	Dip	AXS 674	* Pg 15	Foil or Cellulose Envelope	None
4340000	Micro.Knife	Dip	AXS 674	* Pg 15	Foil or Cellulose Envelope	None
4329000	Lamp bulb	Open roll pack for individual bulbs; package pack for multiple packs.				
4392505	Shaking appar.	Wipe	None	II (Motor only)	"C" Cloth or A-51	Yes
4392 705	Shaking a ppar.	Wipe	None	II (Motor only)	"C" Cloth or A-51	Yes
4403000	Sterilizer	Special instructions - see pages 34 and 35				

SUPPLEMENTARY INFORMATION AND SPECIAL INSTRUCTION FOR CLASS 4 ITEM.

ITEM 4020008, Basal metabolism apparatus, 110 volt, 60 cycle:

4129300, Centrifuge, electric:

4139008, Centrifuge, electric:

1. Block inside a style 1 lightweight (plywood or lightest shock available) box container specially constructed for item after first cleaning by wiping and drying by compressed air blast. All unpainted, non-enameled metal surfaces shall be coated with USA 2-120, light oil preservative.

2. Round off all edges and corners of lightweight wood container with a plane and cover with cloth backed tape. Inclose Silica Gel, effective for a 2 year period.

3. Wrap with at least two layers of heavy draft paper and then overwrap with "C" Cloth and dip or laminated foil moisture-vaporproof barrier such as A-51. Be sure to provide adequate cellulose wadding or other cushioning material over each corner and edge and again overwrap with waterproof paper before overpacking in an approved nailed wood box, style 4 as per JAN-F-106.

4. Make sure when lid is nailed shut that the inner box fits snugly. There should be no movement whatsoever.

ITEM 4101000, Burette, automatic 50cc:

4187000, Condenser:

1. First wrap the burette in cellulose wadding.

2. Inclose in a specially constructed style 1 nailed wood box - $\frac{1}{2}$ " boards or plywood. Four holes are bored through the bottom: two holes, one above the other are located approximately $6\frac{1}{4}$ " from each and one inch from each side. A cord is passed through these holes and around the glass item which is thus securely fastened to a cellulose wadding cushion placed along the entire bottom of box.

3. Overwrap with waterproof paper and overpack with an approved nailed wood box, style 4. Be sure when lid is nailed on outer shipping container that the inside box is tightly held.

ITEM 4403000, Sterilizer:

1. Door handle and catch shall be removed, thoroughly cleaned, dried and processed by dipping in AAS 674, medium oil preservative and wrapped in grade "A", greaseproof paper. They shall then be fastened in oven in such a way that they cannot mar interior during shipment.

2. Burner shall be wrapped in Grade "C", Type 1 material and dipped in compound, Sealing, Dip Coating, AAS-1015. Wrapped burner shall

be placed in a sealed fiberboard or wood box of such dimensions that it cannot move in oven during shipment.

3. Sterilizer shall be snugly packed in a tight fiberboard box of double-wall construction with B or C flutings or a combination thereof. Flaps and flap ends of top and bottom of box shall be sealed with kraft adhesive tape; box shall be placed in a snug-fitting waterproof bag liner and seal made with waterproof adhesive.

4. Fiberboard or fiberboard-covered wood box shall be sealed within waterproof bag liner and packed in a snug-fitting nailed wood box, style 4, conforming to JAN-P-106.

QUANTITY OF CLASS 4 MEDICAL DEPARTMENT ITEMS TO
BE PACKED IN AN ORIGINAL (RE-PACK) CONTAINER.

A - LIMITING FACTORS: WEIGHT - 70 Lbs
SIZE - 4 Cu Ft

AB - PACK IN MULTIPLES OF 12 (SIZE PERMITTING) PLUS
"A". IF SIZE DOES NOT PERMIT, PACK IN MULTIPLES
OF 2-3-4 or 6.

CLASS 5 MEDICAL SUPPLIES.

1. Class 5 Medical Supplies consist of dental equipment and supplies. A natural and logical grouping of these supplies into two parts makes the packing job a less complex one. These two classifications follow:

Items of Simple Design

Examples of this group of class 5 supplies are burnishers, forceps, lancets, scalers and scissors.

Items of Complex Design

Examples of this group include engine, mobile; lathe, dental and heaters.

* Dental items of simple design must be thoroughly cleaned and dried (two successive Stoddard Solvent tanks - compressed air dry - Methanol dip - compressed air dry - oven dry) treated with a proper preservative, wrapped in Grade "A" greasproof material or aluminum foil and packaged in laminated foil or cellulose envelope which is heat-sealed. It is also possible in some instances to package in "C" Cloth and dip and overwrap with kraft paper.

Dental items of complex design must be superficially cleaned of all finger marks or other "dirt" before processing and in nearly all instances a desiccant must be inclosed within a moisture-vaporproof barrier.

Dismantling and packing of the following items should not be attempted without technical assistance from the maintenance section of the processing center:

Item 5653511 - Unit Operating Dental

5653531 - Unit Operating Dental

* (Unit packaging method - page 43)

TABLE III

(NOTE - Where "C" Cloth or A-51 or other foil barrier is optional, in column 6 of following table, always use "C" Cloth whenever package is small enough for wax dip - For all oil and compound coatings excepting AXS-673, use Grade "A" wrapping to hold coating in place.)

ITEM	DESCRIPTION	PROCESSING METHOD TO EMPLOY				
		CLEAN (Wipe or Dip)	PRESER- VATIVE (Oil or Compound)	UNIT PACK- AGING METHOD	UNIT PACK- AGING MATERIAL	DESICCANT (For 2 year Period)
5013000	Articulator	Dip	AXS 674	I-A	"C" Cloth or A-13	None
5033000	Burs	None	None	II	"C" Cloth or A-13	None

ITEM	DESCRIPTION	P R O C E S S I N G M E T H O D T O E M P L O Y				
		CLEAN (Wipe or Dip)	PRESER- VATIVE (Oil or Compound)	UNIT PACK- AGING METHOD	UNIT PACK- AGING MATERIAL	DESICCANT (Per 2 year Period)
5112700	Carrier, amal.	Dip	AXS 674	*	Foil or Cellulose Envelopes	None
5122000	Cement	No	None	IA	"C" Cloth or A-13	None

5431000	Pliers	Dip	AXS 674	*	Foil or Cellulose Envelope	None
5541000	Sealer	Dip	AXS 674	*	Foil or Cellulose Envelope	None

QUANTITY OF CLASS 5 MEDICAL DEPARTMENT ITEMS TO
BE PACKED IN AN ORIGINAL (RE-PACK) CONTAINER.

A - LIMITING FACTORS: WEIGHT - 70 Lbs
SIZE - 4 Cu Ft

AB - PACK IN MULTIPLES OF 12 (SIZE PERMITTING) PLUS
"A". IF SIZE DOES NOT PERMIT, PACK IN MULTIPLES
OF 2-3-4 or 6.

CLASS 6 MEDICAL SUPPLIES.

1. Class 6 Medical Supplies comprise X-ray equipment and supplies. Although this group is not a large one, packing problems are simplified by a division into two classifications as follows:

Items which are Fragile.

X-ray supplies of this type include fluorescent light bulbs, intensifying screens, film holders and lamp bulbs.

Technical X-ray Units requiring processing and crating.

Among this group are X-ray machines and Table X-ray, Urological, etc.

Besides the same careful and specialized treatment required for other glass or fragile items, the Fragile Label (WDAGO Form 433) must appear on three surfaces of the outer shipping container of items like fluorescent light bulbs, X-ray tubes inserts, lamp bulbs, shockproof tube units and shockproof tube heads (including transformer and tube).

When crating is necessary, special care must be taken to see that the equipment is well blocked, padded sufficiently at all points to assure safe shipment and effectively waterproofed. The crate must be fully sheathed and have properly constructed framework and skidded base. X-ray items require special technical operatives who should instruct and supervise all phases of packing technical equipment of this nature. All items must be properly waterproofed.

2. All items that follow require the technical assistance of the maintenance and repair section of the processing center before packing:

Item 6011700 - Cassette, changer, stereoscopic
6013700 - Developing unit
6067000 - Machine, X-ray
6109500 - Machine, X-ray
6121000 - Photocentgenographic Camera Unit
6156800 - Table, 4-position
6158000 - Table, X-ray, urological
6159000 - Table, X-ray, urological X-ray machine
6169200 - Tube stand unit.

TABLE IV

NOTE: Where "C" Cloth or A-51 or other foil barrier is optional, in Column 6 of following table, always use "C" Cloth whenever package is small enough for wax dip - For all oil and compound coatings excepting AXS-673 use Grade "A" wrapping to hold coating in place.

ITEM	DESCRIPTION	P R O C E S S I N G M E T H O D T O E M P L O Y				
		CLEAN (Wipe or Dip)	PRESER- VATIVE (Oil or Compound)	UNIT PACK- AGING METHOD	UNIT PACK- AGING MATERIAL	DESICCANT (For 2 year Period)
6011700	Cassette Changer	Wipe	AXS 674	II	A-50 or "C" Cloth	Yes
(Special instructions - see page 52)						
6019010	Film, X-ray	No	None	IA	"C" Cloth or A-13	None
Wood box, maximum size 2 cubic feet. Special label must be on outside container reading "X-Ray Film"; date of mfg. must be within 6 months of the shipment for overseas' shipment.						
6040500	Illuminator, tube	Cover with cellulose wadding first; then pinch pack with single-faced corrugated material.				
6043005	Lamp bulb	Use open-roll pack for individual bulbs and package pack for multiple packs.				
6067000	Machine, X-ray	Wipe	USA 2-84	II	A-50 or "C" Cloth	Yes
Special instructions - see page 55						

SUPPLEMENTARY INFORMATION AND SPECIAL INSTRUCTIONS FOR CLASS 6 ITEMS.

Item 6011700, Cassett changer, stereoscopic, upright, magnetically controlled.

1. Westinghouse.

a. Dismantling:

- (1) Base - Shall be detached from unit etc., Mounting bolts and setscrews will be replaced in position.
- (2) Vertical Columns - Shall be removed from remainder of unit (connecting brace bar, etc.). Counter-balancing lead weights will remain in position inside vertical columns.
- (3) Castings - Top pulley castings shall be removed from vertical columns and rubber bumpers detached. Mounting and retaining bolts shall be replaced in position. Black tabular sleeves with roller guides shall be removed.
- (4) Cassette Changing Mechanism - Shall remain intact as received from manufacturer. Mechanism will be tied securely to supporting frame (back side) to prevent shifting. Pendulum will be blocked in position with dry, lightweight strips of wood.

Cleaning, Processing and Packaging. All unpainted, non-enameled and plated surfaces shall be cleaned and dried. Parts treated with oil or compound shall be overwrapped or stripped with greaseproof wrapping, Grade "A" material or Grade "C" material, AXS-1015 applied and Kraft overwrapped.

- (1) Base - Setscrews in column receptacles of base shall be cleaned by the "Two-solvent Method", dried, treated with AXS-674, replaced in position and covered with greaseproof wrapping, Grade C, Type I (cloth). Base shall be wrapped with Kraft paper.
- (2) Vertical Columns - Plated vertical columns shall be thoroughly cleaned by brushing or wiping with petroleum solvent and methanol and sprayed or otherwise coated with AXS-674. Columns shall then be wrapped with greaseproof wrapping, Grade C, Type I (cloth) as described above; sealed with wax AXS-1015, "Compound Sealing, Dip Coating" and overwrapped in Kraft paper.
- (3) Castings - The four rubber bumpers (removed from top pulley castings) shall be wrapped in Grade C cloth, double dipped in wax and overwrapped in Kraft paper. Ball bearings and races of top pulley castings shall be cleaned with petroleum solvent and methanol if "dirt" or fingerprints are present; dried; treated with AXS-674; wrapped in Grade C cloth; double dipped in wax and overwrapped in Kraft paper. Top and bottom castings on black crackled tabular sleeves will be cleaned, dried, treated with AXS-674, and, together with sleeve, be packaged in similar manner.
- (4) Cassette Changing Mechanism - Unfinished and plated metallic surfaces, including automatic locks, manual resetting and tripping handle, serial indicating device and races, etc., (In back), subject to corrosion, shall be cleaned as in par. 1b (2) above, and together with ball bearings will be treated with AXS-674. Supply cable and immobilizing band will be packaged together in Grade C cloth, wax dipped, and wrapped in Kraft paper. Cassette Changing Mechanism will be neatly overwrapped in Kraft paper.

Packing. Item will be packed in two specially constructed nailed wood boxes, Style 2, Type 3 loading; constructed in accordance with JAW-P-106. Boxes shall be provided with waterproof paper liners. Liners shall be made with a 2" overlap at all corners and shall be sealed with waterproof adhesive to form absolutely water-tight joints.

(1) Box No. 1 shall contain the following:

a. Wrapped Base - shall be placed at end of box. Two special padded (creped cellulose wadding, felt, cellulose foam or similarly resilient material) cross pieces of sufficient width to give full bearing to under sides of casting ends shall be fastened to bottom of box directly beneath base; 2" x 4" blocks padded on end, shall be placed to hold two ends of web of casting firmly in place and a 2" x 4", padded on both ends shall be fitted firmly between ends of base casting and fastened to floor of box. First horizontal layer of four, 2"x4" collar blocks (cut out in center) shall then be securely fastened in place on bottom of box, the two at base end of box being shortened to fit inside base area.

b. Castings - Short base, cracked tubular sleeve castings, with roller guides, shall be placed on padded collar blocks and secured in position. Top collar blocks will also be adequately padded with creped cellulose wadding, felt, cellulose foam or similarly resilient material. Top pulley casting, immobilizing band and supply cable (from cassette changing mechanism) shall be securely packed in end compartment of box opposite to base.

c. Vertical Columns - Lead weights shall all be securely anchored in place so there can be no possible movement within columns under shock. Anchoring shall be accomplished by use of two wooden blocks per column, one being placed in each end of column against same against ends of lead weight. Blocks shall be of maximum cross sectional area and of lengths which will all cause them to protrude a minimum of 1/2" outside ends of columns. Projecting ends shall rest tightly against "thrust strip" which will absorb end thrust. Ends of blocks inside columns will be notched to permit them to rest directly and evenly against weights. After anchoring of weights in above manner, third horizontal layer of padded collar blocks shall be placed in position and V-braces securely nailed into place. Ends of all collar blocks shall be nailed into blocks on sides of box.

(2) Box No. 2 shall contain the following:

a. Cassette Changing Mechanism - Shall be boxed in a light-weight, inner, nailed wood box of thoroughly

dry (preferably salvage) material. Sides and ends shall be $\frac{1}{2}$ " in thickness; top and bottom shall be $\frac{1}{2}$ " plywood. Box shall be provided with blocking as shown and approximately $\frac{1}{2}$ " of cellulose wadding, cellufoam, felt, or similar resilient padding, shall be placed between mechanism and all points of contact with box or blocking. Sufficient silica gel (approximately 25%) to give protection for a two year period shall be placed in the box (with proper allowance for damage) in such manner that it will not touch any metal parts. If necessary, silica gel will be separated from metal parts by a shield of laminated foil. Following closure of inner box, all corners and sharp edges will be well rounded and smoothed with plane and taped with cloth-backed tape. Box shall be overwrapped with at least one layer of Grade C cloth; joints shall be wax sealed; pack shall be wrapped in kraft paper and placed in close-fitting bag of laminated foil (Reynolds Metals Company A-50 or equal). Bag shall be stripped on inside with cloth-backed tape (when made) where it will contact corners of box and excess air shall be withdrawn by suction as final closure is made. Pack shall be overwrapped in at least two layers of waterproof paper; joints shall be sealed with waterproof adhesive and wrapped box placed in a close fitting nailed wood box, style 2, constructed in accordance with JN-P-106. Corners of waterproof paper-wrapped pack shall be well padded where they fit into outer container.

2. General Electric. (1) Dismantling, cleaning, processing, packaging and packing shall be in conformance with the principles outlined for Westinghouse type. Cassette changing mechanism with electric motor shall be packed Method II in a lightweight, inner, nailed wood box of thoroughly dry lumber, using inner blocking, silica gel and packaging principles as heretofore outlined. Base will be securely blocked and packed in a second nailed wood box and the vertical portion in a third.

Item 6067000, Machine, X-ray, bedside, mobile, shockproof, complete.

1. The tubes and control boxes are usually broken when the following is not considered. The tube stand is made of light metal and will not stand rough handling. Item must be well braced internally with padded braces and shipping case must be well braced and completely sheathed.
2. All unpainted metallic parts or metallic parts not processed against corrosion or uncleaned must be cleaned thoroughly of all finger marks and other "dirt" and treated against corrosion.
3. The whole control box should then be packaged Method II, with desiccant, for a minimum period of two (2) years. Moisture-vaporproof barrier should be A-50 preferably. Barrier should be padded wherever necessary, inside and

outside, to prevent puncture during shipment and handling. Desiccant must not touch parts of item directly, but should be separated by metal-foil shield.

QUANTITY OF CLASS 6 MEDICAL DEPARTMENT ITEMS TO BE PACKED IN AN ORIGINAL (RE-PACK) CONTAINER.

A - LETHAL FACTORS; WEIGHT - 70 Lbs
SIZE - 4 Cu Ft

AB - PACK IN MULTIPLES OF 12 (SIZE PERMITTING) PLUS "A". IF SIZE DOES NOT PERMIT, PACK IN MULTIPLES OF 2-3-4 or 6.

CLASS 7 MEDICAL SUPPLIES

1. Class 7 is one of the largest single divisions of medical supplies. It includes furniture, linen and bedding, mess equipment and supplies, cleaning and preserving equipment and supplies, stationery and office equipment and supplies and miscellaneous equipment and supplies.

To simplify the overall picture, when thinking of Class 7 items in terms of packing procedures, it is convenient to divide them into four distinct groups. These four classifications follow:

Fragile and glass items

Lamp bulbs, jars, bottles, etc.

Non-Fragile items but requiring protection against soiling.

Blankets, linens, pajamas, etc.

Items simple in design requiring processing.

Knives, forks, tools of all kinds, etc.

Items complex in design requiring processing.

Typewriters, generators, scales, etc.

Practically all packing methods are applicable to certain items within this large group of medical supplies. It becomes necessary therefore for the packing officer to select the applicable method for the particular item to be shipped.

2. Dismantling and packing of the following items should not be attempted without assistance from the maintenance section of the processing center:

7103005 - 08 - Bath, arm, whirlpool.

7103505 - 06 - Diathermy apparatus.

7375505 - Refrigerators, mechanical.

7791000 - Disinfecter trailer type

7833503 - 07 - Lamp Operating ceiling

7833705 - 08 - Lamp Operating, emergency, portable

7910005 - 10 -

13 - Sterilizers Hospital complete

TABLE V

NOTE - Where "C" Cloth or A-51 or other foil barrier is optional, in column 6 of following table, always use "C" Cloth whenever package is small enough for wax dip - For all oil and compound coatings excepting AXS-673, use Grade "A" wrapping to hold coating in place.)

SUPPLEMENTARY INFORMATION AND SPECIAL INSTRUCTIONS FOR CLASS 7
ITEMS.

ITEM: 7043000 Chair Invalid,

1. This chair should (as 7046000) be packed in knock-down form in a closefitting Style 4, nailed wood box, built to conform in lumber grade, parts sizes, nail sizes and types, nailing, strapping and every other detail with the requirements of JAN Specification P-106 for this type of container for the load carried.
2. All non-painted or enameled metal parts must be cleaned thoroughly and AXS-673 preservative put on. Parts such as threaded nuts and bolts must not be overlooked.
3. In packing the chair, the different parts should be separated from one another by dry excelsior pads and the whole should be strapped together with 2 flat metal bands $\frac{1}{2}$ " x .020", deeply padded where in contact with wood surfaces, to prevent the individual movement of knocked-down parts.

ITEM: 7046000, Chair specialists,

1. Chair back, head rest and arm rests shall be packed in opening beneath chair seat and chair shall be otherwise assembled to require the least possible amount of cubage consistent with reasonably quick assembly with simple tools; chair frame and parts shall be well padded with double-walled fiberboard wherever they are packed in contact with one another and padding shall be securely tied down in such a way that movement under shock of handling will not be possible.
2. Knocked down chair shall be snugly packed in a tight fitting fiberboard box of double-wall construction with B or C flutings or a combination thereof, flaps and flap ends of top and bottom of box shall be sealed with kraft adhesive tape, box shall be placed in a snug-fitting waterproof bag liner and water-tight seal made. (Style 1 wood box of $\frac{1}{2}$ " lumber or plywood lined with double-faced corrugated or fiberboard might be substituted.) All non-painted or non-enameled metal parts must be cleaned thoroughly and AXS-673 put on prior to packing. Parts such as threaded nuts and bolts must not be overlooked.
3. Bag liner, fiberboard or light wood box and chair shall be packed in a snug-fitting, style 4, nailed wood box, built to conform in lumber grade, parts sizes, nails sizes and types, nailing, strapping and every other detail with the requirements of JAN Specifications P-106 for this type of container.

ITEM: 7074000, Safe:

1. All non-painted or non-enameled metal parts must be cleaned thoroughly and AXS-673 preservative put on.
2. The combination must be conspicuously and securely glued to the outer side of the safe door and the manufacturer's instructions on how to change the combination placed in the safe.
3. The safe will be crated in a fully sheathed crate, securely belted to the skids.
4. The serial number will be plainly stenciled on the crate and the gross weight clearly marked.

ITEM: 7095000, Table, instrument:

1. All non-painted or non-enameled metal parts must be cleaned thoroughly and AXS-673 preservative put on. Parts such as treated nuts and bolts require careful treatment.
2. Removal of the castors and their attachment in a small cloth bag is recommended.
3. Table should be snugly packed in a tight fitting fiberboard box of double-wall construction with B or C flutings or a combination thereof; flaps and flap ends of top and bottom of box shall be sealed with kraft adhesive tape; (light, style 1 wood box, lined with double faced corrugated or fiberboard may be substituted) box shall be placed in a snug-fitting water-proof bag liner and water-tight seal made.
4. Bag liner, fiberboard box or light wood box and table shall be packed in a snug-fitting, style 4, nailed wood box, built to conform in lumber grade, parts sizes, nail sizes and types, nailing, strapping and every other detail with the requirements of JAN Specification P-106 for this type of container.

ITEM 7103005, Bath, Arm:

1. The metal stand beneath tank shall be detached and the four short bolts replaced in bolt holes with one paper washer between head of bolt and tank and the other between tank and nut. All bolts and nuts should be cleaned, dried and dipped in AXS-674 preservative.
2. Electric motor may be detached from bracket and from turbine and shaft assembly at motor hub. If done, simple directions for reassembly, together with each size of Allen wrench needed, for reassembly must be placed in a kraft envelope and attached to turbine and shaft portion. Motor shall be tightly wrapped in Grade C Type I material in such manner

as to give a minimum of entrapped air and double dipped in Compound, Sealing, Dip Coating AXS-1015. A sufficient quantity of activated silica gel shall be inclosed in the wrap prior to sealing. Turbine and shaft assembly shall be well wrapped in 60 ply, asphalt treated dimple embossed, creped cellulose wadding, wrapped pads, Type 500, as manufactured by Kimberly-Clark Corporation, Neenah, Wisconsin, or equal and overwrapped with 60 lb kraft paper. In case motor is not removed as suggested the whole assembly must be treated as outlined for motor. Metal stand, extra fittings and wrapped turbine and shaft assembly shall be tightly packed together, well padded from one another, in a large fiberboard box placed in bottom of tank which will be blocked to prevent vertical movement during handling. Box shall be of such length that corners will contact rounded portions of tank sides thus allowing no longitudinal or sidewise movement. It shall be sealed along flap openings and ends of both top and bottom with 60 lb gummed kraft tape of 2" width. Fifteen ply, asphalt treated, creped cellulose wadding wrapped pads, shall be placed between entire bottom and side areas of fiber box and inside of tank wherever they are in contact with one another.

3. Packed tank with 2" threaded pipe projecting below and 3/4" rod projecting above shall be placed on its side in center compartment of style 2 nailed wood box which shall conform in every detail, particularly as to lumber grade, parts dimensions, nails, nailing and strapping with the provisions of JAN-P-106 for this type of container. Box shall be lined with Type L-2 waterproof paper. Center compartment shall be 3/4" wider than height of tank when in upright position. Holes shall be bored or cut through center compartment side walls to allow 2" pipe and elbow to project into one side compartment of box and 3/4" rod into the other. Side compartment receiving 3/4" rod shall be of such width that rod end will come within 1/8" of side of box. Center and side compartments will be 3/4" longer on each end than packed tank which will be rigidly held in place by pipe and rod passing through the compartment. Inside depth of box shall be 3/4" more than width of tank when in upright position. Wrapped motor will be placed in sub-compartment in compartment carrying 2" pipe end in such manner that movement during shipment is impossible. Walls of sub-compartment will be of wood and width of compartment will be equal to diameter of wrapped motor plus 3.4". Outside wall of sub-compartment will be formed by outside of box.

4. Sixty ply, asphalt treated, creped cellulose wadding wrapped pads, Type 500, as manufactured by Kimberly-Clark Corporation, Neenah, Wisconsin, or equal shall be placed between top and bottom edges of tank and center-compartment walls to protect enamel. Similar pads of sufficient width and number to protect bath against damage during shipment and

handling shall be placed between sides and ends of tank and center compartment walls. Pads will be placed anywhere else where tank or parts might need protection or wear through the waterproof paper box lining during shipment. Wrapped motor will be overwrapped with 60 ply cellulose wadding pads before being blocked into sub-compartments.

5. Lining of box shall be done as box is assembled. Waterproof paper covering inside faces of ends shall be $1\frac{1}{2}$ " longer in each direction than the end and shall extend $\frac{3}{4}$ " over each edge so that it can be turned back over the edge of box ends when sides, top and bottom are nailed into place. Waterproof paper shall cover entire inside surfaces of box: sides, top and bottom. A $\frac{3}{4}$ " band of waterproof adhesive, evenly applied, will be placed beneath box sides, top and bottom where they contact edges of box ends to give a water-tight joint. Where nails are driven through wall lining asphalt shall be placed over ends of number being nailed into, to give a water-tight joint around nail shank.

6. Book of instructions will be placed inside arm bath case.

ITEM 7160500, Mattress, Cotton:

1. Mattress Pack - Four mattresses, full length shall be rigidly tied together with two ply twisted jute, sisal or other suitable cord having a tensile strength of not less than 268 pounds. The cord shall be applied in one piece so as to divide the length of the package into four and the width into two equal segments. A secure knot shall be made at each cross-over of the cord.

2. Inner Paper Wrap - Mattress pack shall be wrapped in No. 2 Kraft paper, 160 pounds per 1000 sheets, based on size 24" x 36". Wrap shall consist of not more than two pieces with edges overlapping not less than 5" along length of pack and girthwise around pack, both overlaps to be securely taped with 60 pounds (Grade B), basic weight, $2\frac{1}{2}$ " or 4" width, gummed Kraft paper. Ends of Kraft sheets shall project not less than 16" beyond ends of mattress pack when pack is placed on them. After forming wrap around mattress pack sides of end projection shall be folded in, bottoms folded up, and tops folded down to form neat, tightly compressed ends. These shall be taped into position with gummed Kraft-paper tape as specified above.

3. Outer Paper Wrap - Inner paper wrapped pack of four mattresses shall be sealed in a close fitting, side-opening, coffee-bag closure type envelope of 60/120/30/70/30, reinforced, waterproof paper type E-2 or equivalent with outside ply creped and saturated with asphalt. Bag must be provided with sealable

air vent for exhausting entrapped air by vacuum suction closure (necessary to exhaust entrapped air during closure). Bag joints and seams must be made in such manner as to provide protection equal to that expected of body material. Closure shall be made by pulling up mouth to extended position; facing inside lips of bag together for their full length; placing a 2" ribbon of insulmastic or other waterproof adhesive along one inside lip approximately $1\frac{1}{2}$ " in from edge of bag. Neck of bag shall then be folded over and down in widths approximately 2" (while entrapped air is exhausted) until folds lie tightly against top of pack (coffee bag type closure). Ears shall be folded against side of pack, air vent sealed and $5/8$ " flat metal straps applied, three being placed girthwise and one lengthwise. Before drawing banding tight, insert pieces of corrugated paperboard under straps at corners to prevent cutting. These metal bands shall be of minimum of 80,000 lbs per square inch tensile strength, treated against rust and placed to parallel edges of pack. Cross over seals shall be placed at the three cross over points on faces of pack.

ITEM 7230005, Cart, Food, Drinkwater:

1. All metal parts which are either unpainted or unenameled must be carefully cleaned, processed and wrapped with grease-proof paper.

2. The component parts of the complete unit, including one chassis, one platform, one large cabinet equipped with six food containers or two small cabinets each equipped with five food containers shall be placed with the exception of the wheels, handle bar and other detachable parts, in a nailed wood box. Wheels, handle bar and other detachable parts shall be wrapped with kraft paper and packed tightly in a flat fiberboard box or style 1 wood box and included with above. The component parts shall be wrapped in 30 lb kraft paper, and where finish might become damaged during shipment or where sharp edges, corners or projections might damage bag liner, creped cellulose wadding of adequate thickness shall be used inside bag liner as a protection.

3. The nailed wood box shall conform to provisions of JAN-P-106 Style 2 $\frac{1}{2}$, difficult load. It shall be strapped and shall carry a waterproof bag liner. The waterproof bag liner shall be made of Type L-2 paper. All seams, joints and closures shall be sealed with asphaltum or a non-water-soluble adhesive and shall be made in such manner as to provide equal to that expected of the body material.

ITEM 7375585, Refrigerator, Mechanical:

1. This refrigerator has been found to be corroded due to leakage of refrigerant. Stocks on hand will be examined to determine whether leakage has occurred and any defective mechanical parts will be replaced. All refrigerators so examined will

be marked on the outside of the case - "Inspected for leakage
(date) _____, by _____."

2. The two by fours placed on the back of the refrigerator by the manufacturer are left in place and the back panel of the crate securely fastened with screws to them. The front panel of the crate is designed so that it can be removed to permit the operation of the refrigerator without its removal from the box. Kerosene burner is removed from fuel tank, cleaned, given a method II pack and placed inside of refrigerator. All polished and unpainted surfaces are coated with AXS-674 and wrapped with greaseproof wrapping.

3. A fully sheathed skid design crate is constructed, using one (1) inch lumber and lined with L-2 or better paper. Hardwood two by fours are used as skids.

4. Refrigerator is placed on skid base, (the feet over pins provided by manufacturer) and the crate built around it. Refrigerator is cushioned in the crate along all corners with Kimpak or cellufoam pads or, when they can be salvaged, the pads provided by manufacturer.

5. When the crate panels are manufactured, the paper liner is allowed to extend over the edges of the panel. When the crate is assembled, an asphalt preparation (Insulmastic) or waterproof adhesive is applied around the entire edge of the panels on the overlap surface of the paper. The crate is then nailed together, through the two layers of waterproof paper and the asphalt, to provide a weatherproof box.

6. Standard corner irons, size 1/16 x 1 x 16 inches are then applied to all corners after which an asphalt material is applied on top of the box and covered with paper.

7. Refrigerator, Kerosene, will always be shipped with 1 dozen wicks. These wicks will be packed within the shipping case if practicable; otherwise they will be shipped parcel post.

Refrigerator, Electric Type (Non-sealed unit):

1. Parts requiring processing shall be thoroughly cleaned and dried prior to application of preservatives. In all cases coating shall be complete. Where required, preservatives shall be allowed to harden properly before completion of processing. A defective painted surface, where paint has been scraped or otherwise removed, shall be thoroughly cleaned and repainted prior to crating.

2. Grease and oil cups shall be covered with Grade C wrapper. Wrapper shall be sealed with wax, AXS 1015.

3. Switches, switch boxes and gages shall be covered with

Grade C wrapper which shall be sealed with wax and switch boxes shall be provided with an adequate amount of Silica Gel to provide protection for a two year period.

4. Fittings shall be treated with compound, Rust Preventive, Thin Film, AXS 673. (Kendall No. 5) Chains, gears, sprockets and moving parts shall be covered with a non-corrosive pressure sensitive tape, or with Grade C greaseproof wrapper, suitably sealed to keep out excess moisture.

5. Leather belts shall be disconnected, wrapped in Grade C, Type 1 (cloth) greaseproof wrapping and double dipped with wax. Pulleys shall be coated with a rust preventative AXS-673. Where composition belt is used, a paper shall be inserted between the belt and metal contacting surfaces. This paper shall be free from wax or tar.

6. Tools, spare parts or parts of equipment not specifically referred to shall be suitably treated against corrosion before packing and shall be wrapped in a Grade C greaseproof wrapping and sealed with wax AXS-1015. Where spare parts or disconnected parts are then packed in boxes and inclosed in refrigeration unit, they shall be packed in shredded wax paper or other cushioning material and covered with waterproof paper. The spare parts box shall be securely fastened inside refrigeration unit to prevent movement during shipment. Tools and spare or disconnected parts should be wrapped separately and all items shall be suitably marked to permit identification without unwrapping.

Refrigerators, Electric Type (with sealed unit):

1. A "sealed unit" is one where the motor and compressor are hermetically sealed and no further protection is required. If and when a refrigerator having an open type motor, is packed, the motor is removed and Method II packed and securely fastened to the skid base. All exposed wires such as terminals are disconnected, coated with compound, insulation, ignition AXS-353, wrapped with waterproof, corrosion resisting material, (including the automatic control (Solenoid switch) and securely tied to the refrigerator frame to prevent damage in transit. This is a very simple disassembly but all wires are tagged as a means of easy identification.

2. Unpainted surfaces should be cleaned and coated with corrosion resistant film.

3. Crate design and assembly is the same as for kerosene type.

ITEM 7132300, Lamp Therapeutic:

1. In packing, the different major parts should be dis-

assembled. The elements and lens should be carefully packed within a Style 1 wood box using cellulose wadding or a soft blanket insulation to absorb shock. The box should be lined (with moisture-vaporproof barrier) with double-faced corrugated board added cushioning and the fit must be tight enough to prevent any possible movement during shipment and rough handling. Before packing the elements and lens within the box, remove all fingerprints and all other forms of "dirt" and apply a coating of AXS-674 to all uncoated or unpainted metal parts. Grade A greaseproof paper shall be used to hold the coating in place.

2. Before closure of the moisture-vaporproof barrier, sealed inside the style 1 wood box, using Method II (cushioned bag type wrap), a sufficient quantity of silica gel should be tied securely inside protection for a period of two years.

3. Parts other than the above will be treated where metal parts are unpainted or un-enameled, will be wrapped in Grade A greaseproof paper and snugly packed within the same style 4 shipping container which incloses the style 1 wood box. The entire contents will be sealed within a waterproof bag liner.

ITEM 7668010, Typewriter:

1. All unpainted or otherwise unfinished surfaces shall be cleaned of fingerprints and/or other "dirt" and sprayed with a light coating of Oil, Lubricating, Preservative, medium, AXS-674. Grade "A" greaseproof wrapping must be taped around parts to prevent dripping and loss of preservative.

2. Typewriter shall be bolted securely to base within wood shipping container which must be made to fit exactly and be lined with waterproof paper. After bolting typewriter securely to base, tie carriage with ribbon so that no possible movement might occur in shipment. Pack keyboard with tissue paper. Shipping container must be style 2, 2 $\frac{1}{2}$, or 3 nailed wood box 3/4" stock throughout and of well-seasoned lumber.

3. Before closure of moisture-vaporproof barrier to be sealed about machine by using method II (floating bag), a sufficient quantity of silica gel (packed in dust proof bags) to give protection for a period of two years, shall be placed in the typebar nest and tied securely to prevent movement during shipment and handling. Silica Gel shall be shielded from direct contact with typewriter by means of a sheet of paper-backed or cloth backed metal foil.

ITEM 7791000, Disinfector Portable:

1. Steam-clean the unit thoroughly. If steam-cleaning equipment is not available use any other effective method, such as alkaline or solvent washing, to remove dirt, oil and excess

grease. If paint has deteriorated or is damaged in cleaning, remove loose paint and rust and repaint the area.

2. Lubricate machine according to War Department Corps of Engineers Lubrication Guide No. 1024. (Note: Change of crankcase oil, a separate operation performed after processing, is not included in this lubrication).

3. Before removing any part from the machine, paint or stencil match-marks on parts being removed and mating parts remaining on the machine. Use 2-inch stencil and lusterless blue drab enamel.

4. Place box base on 8 x 8-inch blocks to facilitate fitting washers and nuts on tie-down bolts.

5. Counterbore sills of fully sheathed crate underneath box for bolt heads.

6. Remove filler plug and fill priming chamber of pump with water. Replace plug.

7. Crankcase. Run engine about 30 seconds, then stop and drain crankcase. Fill crankcase with one pint of Internal Rust Preventive AXS-934 through carburetor or air intake until engine dies. If engine does not stop shut off ignition when exhaust emits dense blue smoke. Drain crankcase. Wire to terminal of spark plug and ground to motor, this red caution tag, "Crankcase was shipped dry. Do not start until crankcase has been filled."

8. Valve compartment. Remove valve inspection cover and thoroughly clean inside of cover and compartment. Spray valve stems, tappets, springs, etc. with AXS-934 so that all parts will be thoroughly coated. Seal all vents or breathers in the valve inspection cover with tape.

9. Cylinders. To protect cylinder wall, piston head and valves, spray approximately 2 ounces of Internal Rust Preventive Lubricant AXS-934 into the cylinder through spark plug hole while engine is hand rotated slowly about five revolutions. Spraying assures a complete coat of rust preventive lubricant on the cylinder wall, piston and valve assembly.

10. Spark plug. Inspect, clean and adjust the spark plug. If still servicable, apply Internal Rust Preventive Lubricant AXS-934 to the point and threads on terminal and body, and replace in engine; if not servicable, install a new spark plug, processed in the same manner.

11. Fuel System. Drain carburetor, sediment bowl, fuel lines and fuel tank. Apply external rust preventive compound to controls and threads of all fuel system parts. Fog interior

of fuel tank with AXS-934, Grade 10, and if any excess accumulates, drain out.

12. Magneto. Cover all vents or openings with tape and spray AXS-858 over the magneto and the entire electrical system of the engine, including exterior of spark plugs, ignition coil and wires. If approved insulation compound is not available, protect the magneto with water-proof paper held in place with cement, tape or cord.

13. Remove water pump drain plug.

14. Remove suction head and check valve assembly by removing the four stud nuts. Dry interior of pump thoroughly.

15. While pump is hand rotated spray or fog its interior with Internal Rust Preventive Lubricant AXS-934. Replace suction and check valve assembly, being careful not to damage gasket. Do not permit preventive to contact the rubber valve seat.

16. Insert sealing cap in suction inlet.

17. Cover discharge outlet with tape.

18. Replace drain plug.

19. Adjust belts to their proper tension, and prevent them from adhering to pulleys by inserting a thin strip of paper, free from wax or oil, between them and the pulleys. If practical, apply Insulation Compound AXS-858 or similar material to exposed pulley grooves. DO NOT ROTATE ENGINE AFTER THIS OPERATION.

20. Cover pressure gages and water glasses with corrugated paper, wrap with waterproof paper and seal with holding tape.

21. Apply AXS-674 to all valve stems, pump shafts and safety valves. (Note; Leave all valves partially open.)

22. Coat with AXS-673 all unpainted threads, springs, chains, pins, hinges, fasteners and other parts subject to corrosion.

23. Process and package all spare parts and tools specified in the check list. Place spare parts in a durable wooden container and stencil the words "Spare Parts" on top and two sides.

24. Wrap and place processed tools in metal tool box mounted on equipment. Cover the side openings with taps. Do not place tool and spare parts in the same container.

25. Cover manuals with a grade "C" wrapper. Seal and

pack them in Lubrication Guide Holder or tool box.

26. Place a bundle of clean dry wiping rags or waste in any available space on the unit.

27. Raise the unit and demount wheels. Place wheels and unit on platform, of fully sheathed crate, block and tie-down securely.

28. Complete construction of fully sheathed crate by nailing prefabricated sides securely with sides of sills; by fastening ends in place and by placing cross braced top.

29. Apply angle irons at corners.

ITEM 7833705, Lamp, Operating, Emergency, Portable, 110 V., 60 Cycle:

1. This item is shipped in three pieces as follows: The lamp, the battery and the electro-lite. The electro-lite must be added to the battery before a certain date or the battery plates will be damaged. Battery would be harder to charge but no actual damage results. The battery requires special packing because the battery shell is glass. The electro-lite must be shipped with acid label. Both the electro-lite and battery must be shipped within individual shipping containers, style 4 nailed wood box and each sealed within a waterproof liner with a waterproof adhesive water-tight. The wood box must be built to conform in lumber grade, parts sizes, nail sizes and types, nailing, strapping and every other detail with the requirements of JAN-P-106 for this type of container.

2. The lamp must be packed with all the care needed for a fragile item. Before packing, it must be cleaned and dried, and all metallic parts not coated with enamel or paint, properly processed.

ITEM 7844000, Litter:

Litters shipped overseas will not be crated. Where damage in lots of stock on hand have been uncovered these lots should be opened and inspected before shipment. Corrugated cardboard should be placed between the folds of the canvas and back of the large bolt which holds the stirrup and between the folded litters. The canvas cover must be folded carefully to avoid pinching. Arrange two litters to the bundle, back-to-back, stirrups outside. Cover the stirrups and braces with excelsior-packed paper cushioning. Tie handles with cord, making a tight bundle. (For Item 7844000, Litter, Wood, place two metal straps through the stirrups and bind tightly.) Use three sheets of waterproof paper for outer wrapping. Fold one piece over each end and third piece around the middle. Strap tightly with four flat metal straps placed outside and inside the stirrups.

TABLE SHOWING QUANTITY OF TEXTILES IN STANDARD BALES

<u>Item No.</u>	<u>Item</u>	<u>Number in Bale</u>
7201000	Apron, Cooks	150
7151000	Bag, Laundry, Large	18
7152000	Bag, Laundry, Small	50

QUANTITY OF CLASS 7 MEDICAL DEPARTMENT ITEMS TO BE
 PACKED IN AN ORIGINAL (RE-PACK) CONTAINER

A - Limiting Factors: Weight - 70 lbs
 Size - 4 Cu Ft

AB - Pack in Multiple of 12 (Size permitting) plus "A". If
 size does not permit, pack in multiple of 2, 3, 4 or 6.

CLASS 8 MEDICAL SUPPLIES.

1. Class 8 Medical Supplies comprise Veterinary Equipment and supplies. For packing classification, they are divided into the following:

Items requiring processing.

This group includes veterinary instruments of simple design such as files, forceps, knives, curettes and groovers. Veterinary instruments of complex design form the second part of this group and include such items as furnace and caldron, clipper, electric and disinfectant.

Items not requiring processing.

Among this group are included items such as gloves, bandages and vials.

Veterinary instruments of simple design must be thoroughly cleaned and dried, (two successive Stoddard Solvent tanks - compressed air dry - Methanol dip compressed air dry - oven dry) treated with a proper preservative, wrapped in Grade "A" material or aluminum foil and packaged in a laminated foil or cellulose envelope which is heat-sealed. It is also possible in some instances to package in "C" cloth and dip and overwrap with kraft paper.

Veterinary instruments of simple design must be thoroughly cleaned and dried, (two successive Stoddard Solvent tanks - compressed air dry - Methanol dip compressed air dry - oven dry) treated with a proper preservative, wrapped in Grade "A" material or aluminum foil and packaged in a laminated foil or cellulose envelope which is heat-sealed. It is also possible in some instances to package in "C" cloth and dip and overwrap with kraft paper.

Veterinary instruments of complex design must be superficially cleaned of all finger marks or other "dirt" and in many cases metallic parts which are unpainted or processed against corrosion, must be treated with an oil preservative. A desiccant in most instances is required with this group.

Both of the above types of veterinary supplies are so similar to items of Class 3 that by referring to the latter group of items (see page 16 and 17) packing and processing will be simplified.

Many items are of the same types as Class 2 and Class 7 supplies and in most instances, little difficulty should be had in finding similar type items as packing examples.

QUANTITY OF CLASS 8 MEDICAL DEPARTMENT ITEMS

TO BE PACKED IN AN ORIGINAL (RE-PACK) CONTAINER.

A - Limiting Factors: Weight 70 pounds
Size 4 Cu Ft

AB - Pack in multiples of 12 (size permitting), plus "A".
If size does not permit, pack in multiples of 2, 3,
4 or 6.

CLASS 9 MEDICAL SUPPLIES.

1. Class 9 is the large group of supplies comprising Field Equipment and Supplies. Some of these items are found among practically all the other eight groups of medical supplies and some are new. In addition to the packing methods already outlined for other classes of supply, there are many special procedures necessary because of a large group of technical items, each requiring special precautionary measures in order to assure safe shipment and storage.

The overall picture of Class 9 supplies is greatly simplified by separating them into four distinct groups as follows:

Fragile and Glass Items.

Lamp bulbs, laboratory glassware, bottles and jars of drugs and chemicals.

Items - Non-fragile but Requiring Protection against Soiling.

Surgical dressings, blankets, etc.

Items Simple in Design Requiring Processing.

Surgical instruments, tools and all other metallic items of simple design.

Items Complex in Design Requiring Processing.

X-Ray equipment, generators, typewriters and electrical appliances of various types.

2. Dismantling and packing of the following items should not be attempted without technical assistance from the maintenance section of the processing center;

9350000-Anesthesia Apparatus, portable.

9605500-X-Ray field unit, dryer and loading bin, combination.

9606000-X-Ray Field unit generator.

9608508-10-X-Ray field unit, machine X-Ray complete.

9614500-X-Ray field unit, table unit.

9621500-X-Ray field unit fluoroscopic, foreign body localization.

9931500 - Lamp operating field.

9931700 - Lamp operating field generator.

TABLE VI

(NOTE: Where "C" cloth or A-51 or other foil barrier is optional, in Column 6 of following table, always use "C" cloth whenever package is small enough for wax dip - For all oil and compound coatings excepting AXS-673, use Grade "A" wrapping to hold coating in place.)

ITEM	DESCRIPTION	P R O C E S S I N G METHOD TO EMPLOY			
		CLEAN PRESER- (Wipe or Dip) or Compound)	UNIT PACK- AGING METHOD	UNIT PACK- AGING MATERIAL	DESICCANT (For 2 year Period)
9309000	Case, Port Mort	Dip	AXS-674	IA	"C" Cloth None
		All instruments to be dipped, wrapped with Grade "A" greaseproof wrapping. Placed alongside folded case and all packaged within "C" Cloth wrap to be dipped in wax and overwrapped with Kraft paper. Be sure proper identification is on both label on "C" Cloth before dipping and also on overwrap.

SUPPLEMENTARY INFORMATION AND SPECIAL INSTRUCTIONS FOR CIA SS 9 ITEMS.

ITEM 9350000, Anesthesia Apparatus.

1. In packing, the different parts should be disassembled. All parts which are metallic, unpainted or unenameled, must be cleaned thoroughly of all "dirt" and fingerprints and coated with a film of light oil. Use oil, lubricating preservative, medium, AXS-674. Wrap parts coated in Grade "A" greaseproof paper.

2. Pack snugly within lightweight, style 1, wood box must be covered both inside and out with solid fiberboard protective covering and edges taped before inclosing within moisture-vaporproof bag.

3. Inclose Silica Gel for a 2-year period within the style 1 box before sealing the barrier. The desiccant should be within a dustproof bag and wrapped with a foil covering (open top and bottom) so that there is no possibility of desiccant touching item.

4. Overpack with style 4 wood box which meets all specifications of JAN-P-106. Use approved waterproof bag liner.

ITEM 9606000, X-Ray, Field Unit, Generator.

1. The aluminum casting which forms the oil pan of the motor of this item supports the entire weight of the motor and generator. When the generator is turned upside down in transit this casting frequently breaks. Old generators now in the hands of a depot are to be provided with a special strap device which will hold generator unit to channel bar. Whether strap device is available or not, top and bottom blocking inside the case will prevent breakage of the casting under the shocks of handling.

2. Engine should be processed according to instructions given on page 101 for treatment of small, air cooled, internal combustion engine.

3. Unpainted exposed parts of fuel tank, carburetor, generator and other component parts of assembly will be cleaned of finger marks and other "dirt" and treated against corrosion. The whole generator should then be packaged, Method II with desiccant, in bags, for a minimum period of two (2) years. Moisture-vaporproof barrier A-50 or equal should be used. Barrier should be padded wherever necessary, inside and outside, to prevent puncture during shipment and handling. Desiccant must not touch metal parts of item directly, but should be separated by metal-foil shield.

4. Tools should be packaged Method I (Compound USA2-84 and greaseproof paper) and replaced in metal carrying case.

5. Spare parts should be processed and packaged also.

6. Pack in nailed wood box with waterproof bag liner. The box shall comply with JAN-P-106 and the liner with JAN-P-125. Generator case must be well padded against waterproof bag liner to prevent puncture during shipment.

ITEM 9614500, X-Ray Field Unit.

1. To eliminate breakage of fluoroscopic screen packed as component of Item 96145 X-Ray Field Unit, Table Unit, it is desired that the following packaging practices be observed:

a. Screen unit, comprising screen, leaded glass and

bakelite back will be removed from metal frame and untaped to permit separation of the three components.

b. Fluoroscopic screen element will be placed in special parchment paper wrap and cardboard folder (Grade "A" paper and double faced corrugated suitable substitutes); folder will be placed in laminated foil envelope and heat sealed; envelope will be wrapped in kraft paper with end flaps and longitudinal joint neatly taped into position, and will be taped between two layers of double faced corrugated board of same size as envelope.

c. Leaded glass will be wrapped in kraft paper with end flaps and longitudinal joint neatly taped into position and placed between two layers of double faced corrugated board of same size as pieces used to back screen. Plywood strips of thickness of glass and approximately 9/16" in width will be placed around four edges of glass and the two layers of corrugated board (with glass and plywood blocks between) tightly taped together.

d. Bakelite back will be neatly wrapped in kraft paper and taped between two layers of double faced corrugated board of the same size as envelope referred to in b above.

e. Screen, glass and bakelite back sub-units will be placed together, with screen elements in middle and an additional layer of double faced corrugated board on each side. Black fabric hood for screen unit will be placed between one of these layers and adjacent sub-unit. The whole will be tightly taped together into one compact unit, wrapped in Grade "C" greaseproof wrapping, double dipped in wax and overwrapped in kraft paper.

f. Wrapped package will be placed inside a Style 1 wooden box approximately 30 $\frac{1}{2}$ " x 4 $\frac{3}{4}$ " outside dimensions with tightly packed layer of excelsior between box and all parts of package.

g. Wooden box will be placed on edge at end of larger chest of table unit and inclosed with it in Style 2 nailed wood box, approximately 47" x 30 $\frac{1}{2}$ " x 19 $\frac{1}{2}$ ", inside dimensions.

2. The special parchment paper wrap and folder may be procured from E. I. Du Pont de Nemours, Patterson Screen Division, Towanda, Pennsylvania, at a cost of approximately 17¢ per unit.

3. Laminated foil for screen envelope should be A-13 as manufactured by Reynolds Metals Company, Richmond, Virginia, or equal.

4. Coat all metallic unprotected surfaces with AXS-673

after cleaning first and drying by compressed "dry" air blast.

Item 9745500, Blanket Set, Large
& 9746500, Blanket Set, Small

To save cube, blankets of these sets should be baled. Some depots bale the twenty four (24) blankets of the large set and the case together. It gives a heavier bale than desired, particularly for handling in the tropics. The practice is, however, acceptable. In forming the bale, naphthalene flakes should be placed between blankets. At least one depot bales blankets for sets in standard bales of twenty each, several sets of four additional blankets and cases being shipped in a second unit. If this scheme is used, the packing officer should make sure that markings are for sets. The bale for the tropics should be effectively waterproofed, preferably with a scaled, waterproof bag liner since all parts are easily attacked by mold, mildew and destructive fungi.

ITEM 9907500, Bed Folding.

1. Two beds placed spring to spring, with legs folded level with or below level of frame sides will be tightly strapped together at six points. One strap, run through protector, (or protectors) will be placed tightly around and against frames at midpoint of ends of each pair of beds; two straps will be placed tightly around each frame side and legs of beds at points just inside, or above leg stretcher or cross piece. To place straps at ends of beds it will be necessary to punch holes through fiber-board caps close to ends of frame.

2. Straps may be of either flat band or round wire type but flat bands are preferred. Presuming flat bands will be used, they must have a minimum cross section of $\frac{1}{8}$ " x .020", an ultimate tensile strength of not less than 30,000 pounds per square inch, and joints must have at least 75% of the tensile strength of the band itself. Round wire must have a tensile strength of 140,000 pounds per square inch and be a minimum of number 15 gage.

3. Transverse straps around pack when received may be left in place if tight, but longitudinal strap or straps (usually loose anyway) will be removed for other depot use or for salvage.

ITEM 9908000, Gatch Frame.

1. This is one of very few items to be packed in an open or slatted crate. Crating is required for protection and easy stacking in the hold of a ship. No waterproof liner is required.

2. Two frames nested together shall be placed face to

face in a flat position, in a crate of 3-way corner design and of such minimum dimensions as will entirely give protection to protruding rods or other parts. Should the giving of such protection mean that crate members do not lie snugly against the two frames, blocking must be employed to give a rigid pack which will stand up under stacking loads of 200 pounds per square foot in every direction.

3. Longitudinal members of crate forming 3-way corner shall lie flat on crate sides to show their edges from front and back of pack and front and back crate faces shall be broken into three equal areas by means of two struts or cross pieces placed at the one third points of crate length and parallel with the 3-way corner cross members. Each of the three face areas so formed on front and back of pack shall carry a diagonal nailed to edges of longitudinal crate members and so placed as to be in the same plane as struts. Diagonals on front of crate should run in opposite direction to those on back.

4. Cement coated 8d nails shall be used throughout with a minimum of three nails at each end of each member. Crate members shall be 1 x 4 stock dressed to a minimum of 25/32" x 3 5/8" and shall be of sound, well seasoned material, free of decay, bad cross grain and knots or knot holes which interfere with nailing, or that occupy more than 1/3 the width of piece.

5. Pack shall be strapped with four straps of nailless, anti-rust treated type, one of which shall be placed at each end of crate directly over and members of crate front and back, the other two of which will be placed to encircle face struts at front and back. Straps will be 1/2" x 020" or wider if of flat metal, and of 14 gauge or better if of wire. If flat they will have a minimum tensile strength of 80,000 pounds; if round, of 100,000 pounds per square inch. Straps will be stapled at intervals of 6" around the crate, wherever possible, with cement coated staples of No. 14 gauge. The longest length of that will retain its points within the 25/32" stock when driven, shall be used.

6. All nuts and bolts and metallic parts to be cleaned and dried and coated with AXS-673.

ITEM 9910000, Boiler, Steam, Upright.

1. Prior to making shipment overseas, subject item will be given corrosion prevention treatment in conformity with the following:

a. Inspection - All parts will be given a thorough inspection to make certain that they are in first class mechanical condition. Care will be taken to make certain that all required tools, spare parts, manufacturer's catalogs,

accessories and attachments are on hand.

b. Cleaning - Unit will be thoroughly steam cleaned. If steam cleaning equipment is not available any other effective method of cleaning such as an alkaline or solvent wash to remove dirt, oil and excess grease may be used. If paint deteriorates or is damaged during cleaning, it will be removed and the area repainted.

c. Lubrication - Lubrication will be done according to manufacturer's recommendations.

d. Processing - All exposed threads, bolts, and valve exteriors will be covered with rust preventive compound AXS-673. Gages and other fine parts such as ignition transformer, protect-o-relay, boiler feed pump, starter, etc., will be wrapped with Grade "C", Type 1 wrapper and sealed with AXS-1015 or equal. Where U. S. Army Specification 3-182 (AXS-858) is available, spray or brush all electric conduits and connections. Pulleys will be stripped between pulley and fan belt with a Grade "B" grease-proof, wax-free paper as described in Ordnance Specification AXS-840, to prevent belt adhering to pulley during shipment. All openings where interior may be damaged by corrosion will be sealed with moisture-vapor resistant tape or Grade "C", Type 1 wrapping to minimize the entrance of moisture-vapor during shipment.

e. Spare parts and Manuals - Spare parts of delicate type are to be wrapped in Grade "C", Type 1 wrapper and sealed with AXS-1015. Tools will be dipped in a rust inhibiting compound USA 2-84 and wrapped in a grease-proof paper. Manuals will be wrapped in a non-creped waterproof paper and all package joints sealed with waterproof adhesive. Spare parts, tools and manuals will be securely fastened to boiler or crate in a manner which will prevent damage during shipment.

f. Electric Motor - Electric motor will be wrapped in Grade "C", Type 1 wrapping and a sufficient amount of silica gel placed inside the package to prepare it for twenty-four (24) months. Sealing of motor package will be done with AXS-1015 and a cloth tag placed on outside to call attention to the presence of silica gel and to warn that all wrappings must be removed before motor is started.

g. Pipe - 200 feet of 3/4" pipe in ten foot lengths accompany each boiler. To get this in the same box with boiler, these pipes will be cut into five foot lengths and threaded, AXS-673 being applied to all threads and couplings to prevent corrosion. Pipe will be placed in the same crate as boiler but will be securely strapped down to prevent shifting during shipment. It must be blocked away from boiler in such a manner that it cannot damage same.

2. Following the procedure outlined in paragraph 2 above, boiler will be crated in a fully sheathed crate. In order to insure the correct fit of crate it will be necessary to check dimensions of boiler or boilers, allowing approximately 3/4" between sides, ends and top of boiler and inside of crate. On one type of boiler the angle iron base is already drilled for bolts; on another type it is not and bolt holes will have to be drilled.

3. It is well to remember that all specifications herewith set down are minimum requirements.

ITEM 9914500, Bucket, Stainless Steel or Monel Metal.

1. Each bucket shall be completely coated with corrosion preventative AXS-673. Nested buckets (nest of 3) shall be separated from one another by two strips of plain, embossed, or wrapped pads of water-resistant, non-corrosive, creped cellulose wadding, Kirberly-Clark Corporation, Neenah, Wisconsin, or equal. Strips, at least 3" in width, 1/2" in thickness and approximately twice bucket height plus twice its diameter in length, shall be placed at right angles to one another with crossing point directly under center of bucket and shall be brought up to separate bucket sides, top edges, and other contacting parts from adjacent bucket or buckets. Nest of 3 buckets shall be packed in a close fitting, nailed wood box, Style 4, conforming to the provisions of JAN-P-106, difficult load. All points of possible contact between buckets and wood box, during shipment shall be padded by means of above described wadding.

ITEM 9920500, Cot, Folding.

1. To standardize the depot pack of folding canvas cots for overseas shipment, it is desired that two (2) cots, each neatly packed and securely bound with buckles drawn tight, be packed together cover to cover, and wrapped in Type E-2 water-proof paper. This shall be done in conformity with the following:

a. A sheet of paper 72" long by 48" wide shall be folded lengthwise to form a double sheet 36" long by 48" wide. If desired two sheets 36" x 48" may be used.

b. Side edges of the double sheet shall be folded in for a distance of 8" on each side to form a double sheet 36" long by 32" wide with four thicknesses of paper along each edge.

c. Folded sheet shall be wrapped lengthwise around the two cots and pack shall be strapped with two flat bands, 1/2" x .015" in cross section having a minimum tensile strength of not less than 80,000 pounds per square inch. Straps shall be placed around the bundle approximately 8" from each end.

2. New Procurement by the Quartermaster General for Medical Department requirements will be packed in this manner.

ITEM 9931500, Lamp, Operating, Field.

1. Three (3) 45 volt dry cell batteries (9L016-82) must be inclosed within a fully sheathed crate along with the lamp before shipment is made. The batteries must be packed snugly in a 2.1 cubic wood box and cushioned by means of double-faced corrugated or soled fiberboard lining. This box is fastened on top of the metal lamp case but blocked so that it does not rest directly on it. A waterproof bag must be sealed water-tight about the batteries before the box is closed. Use Minnesota Mining & Mfg. Co. Cement, EC 164 or an approved equivalent. Only the waterproof liners which conform with the provisions of Ordnance Department U. S. Army Tentative Specification AXS-1246, Revision 1, are acceptable.

2. The lamp case must be opened and three pieces of folded double faced corrugated inserted between the glass lens and rubber mat. All metallic parts not already processed against corrosion damage, or painted or enamelled, must be thoroughly cleaned, dried and coated with a suitable preservative. Use Oil preservative AXS-673.

3. The lamp case must be sealed within a waterproof barrier (both adhesive and paper meeting specifications as referred to above) and crated along with the box containing the batteries. One fully sheathed crate will inclose the two separately waterproofed units.

ITEM 9931600, Lamp, Operating, Field, Dolly.

1. Swivel bearings and wheel axles shall be thoroughly cleaned and processed against corrosion with AXS-674 and Grade "A" greasproof paper overwrap. Use AXS-673 for all metallic unprotected parts not overwrapped.

2. Each dolly, complete, individually packaged in a commercial fiberboard container of the smallest possible cube after being overwrapped within a moisture-vaporproof barrier will be overpacked in a close fitting nailed wood box as per Joint Army-Navy Specification JAN-P-106, Type 3 loading. Wood box shall be provided with waterproof paper bag liner in accordance with Joint Army-Navy Specification JAN-P-125, Waterproof Barriers. All Seams, Joints and closures shall be sealed with asphaltum or a non-water soluble adhesive and shall be made in such manner as to provide protection equal to that expected of the body material.

ITEM 9939500, Mattress, Pad.

Pack as for item 7160500, Mattress, Cotton, page 66 & 67.

ITEM 9952300, Sterilizer, 20-inch.

1. The set-up box holding the sterilizer must be opened. All metallic parts which are not painted, enamelled or corrosion processed must be thoroughly cleaned of fingerprints and other "dirt", dried and coated with a preservative. Use oil preservative, Medium, AXS-674 and wrap in greaseproof paper. Be sure that needle valve is adequately coated.

2. Inclose Silica Gel for a 2-year period before sealing the container within a moisture-vaporproof barrier. Use padding on all eight corners of container before wrapping with moisture vaporproof barrier.

3. Moisture-vaporproof liner, set-up box and sterilizer shall be packed within an adequate waterproof bag and sealed in a snug-fitting nailed wood box, style 4, of well seasoned tongued and grooved stock, and conforming with every other detail listed within the requirements of JAN-P-106 for this type of container.

ITEM 9953520, Sterilizer, Instrument, 12 inch, with alcohol burner.

1. The boxes carrying individual sterilizers must be opened. All metallic parts which are not painted, enamelled or corrosion processed must be thoroughly cleaned, dried and coated with a preservative. Use oil preservative, Medium, AXS-674 and wrap in greaseproof paper. Coating shall in no case be heavy enough to run or drip from parts coated.

2. Inclosed Silica Gel for a 2 year period within the individual sterilizer container before sealing within a moisture-vaporproof barrier.

3. Individual containers should be packed six (6) to the wooden box in two layers of three boxes each with the three boxes in each layer being placed side to side. (This will give a rectangular pack approximately 20" x 14" x 9" in inside dimensions which will weigh approximately 43 lbs).

4. Wooden box shall be provided with a waterproof bag liner, constructed in accordance with instructions of this manual and sealed with waterproof adhesive to be water-tight. As the individual boxes are placed in the bag, and extra thickness of the bag type of paper shall be placed as reinforcement at each of the eight bag corners to prevent "punch through" of bag corners by the load. This should also be done before sealing around individual box with the moisture-vapor-proof barrier.

5. The bag liner carrying boxes and sterilizers shall be packed in a snug-fitting, Style 4, nailed wood box of well

seasoned tongued and grooved stock, built to conform in lumber grade, parts sizes, nail sizes and types, nailing, strapping and every other detail with the requirements of JAN-P-106 for this type of container.

ITEM 9954028, Sterilizer, Instrument, 9 3/4", with gasoline burner.

1. The box holding the sterilizer must be opened. All metallic parts which are not painted, enamelled or corrosion processed must be thoroughly cleaned of fingerprints and other "dirt", dried and coated with a corrosion preventative. Use oil, preservative, Medium, AXS-674 and wrap in greaseproof paper. Coating shall in no case be heavy enough to run or drip from parts coated. Be sure that needle valve is adequately protected.

2. Inclose Silica Gel for a 2 year period before wrapping the container within a moisture-proof barrier. Use padding on all corners of container before wrapping with moisture-vapor-proof barrier.

3. These boxes should be packed six (6) to the wooden box, in two layers of three boxes each with the three boxes in each layer being placed side by side. (This will give a rectangular pack approximately 14" x 11 1/2" x 7 1/2" in inside dimensions which will weigh approximately 35 lbs).

4. Wooden box shall be provided with a waterproof bag liner, sealed with waterproof adhesive to be water-tight. As the individual boxes are placed in the bag, extra thicknesses of the bag type of paper shall be placed as reinforcement at each of the eight bag corners to prevent "punch through" by the load.

5. The bag liner carrying boxes and sterilizers shall be packed in a snug-fitting, Style 4, nailed wood box of well seasoned, tongued and grooved stock, built to conform in lumber grade, parts sizes, nail sizes and types, nailing, strapping and every other detail with the requirements of JAN-P-106 for this type of container.

ITEM 9958400, Tray, Food, 6-compartment, Plastic.

(See Item 995800 but do not clean or process. Pack in two units of fifteen each).

ITEM 9958600, Tray, Food, 6-Compartment, Metal

1. Trays must be thoroughly cleaned by two solvent method, dried and coated with oil (AXS-674). They will be nested in units of ten (10), and wrapped with Grade A grease-proof paper and overwrapped in kraft paper.

2. Twenty (20) trays, (two units of ten each), shall be packed in a snug-fitting nailed wood box, Style 4 (if received by the depot in a V1S or V2S V-Board container, container must be opened, trays processed as outlined, and repacked in V-Board container for shipment). The units shall be packed face to face (top of tray) in the box. Faces of adjacent units shall be separated by means of a double-faced solid-fiberboard sheet cut to full inside dimensions of the shipping container.

3. Trays will be packed within a waterproof liner, sealed with a waterproof adhesive. (Should the shipping container be an approved V-Board type, it must be reinforced with two flat steel straps applied at right angles to each other, centered over the top, sides and bottom and the top, ends and bottom and sealed at the two intersections.)

CLEANING, PRESERVATION AND PACKAGING OF SMALL AIR COOLED INTERNAL COMBUSTION ENGINES.

Among Medical Department items are several with gasoline engines. Notable among these are the X-ray field generator and the field disinfecter. Wherever an item embodies such an engine it must be cleaned and otherwise treated in conformity with the following:

- (1) Run-in and test engine using white unloaded gasoline.
- (2) Drain crankcase of oil and refill with oil, engine preservative, Ordnance Department Specification AXS-934. Operate engine for not less than five (5) minutes with crankcase filled as above.
- (3) Remove spark plugs. Spray carefully into each cylinder with oil, engine preservative, Ordnance Department Specification AXS-934, while rotating engine by hand. Use air atomizing type spray gun and compressed air from which all moisture has been removed.
- (4) Replace spark plugs.
- (5) Drain fuel system, including gas lines, carburetor, strainer, fuel pump and tank and attach "caution tag" indicating engine has been so drained. Filter oil before reuse, when contaminated or cloudy.
- (6) After engine has cooled, remove grease and dirt from exterior and coat all unprotected metal surfaces and threaded parts with compound, rust

preventive, thin film, AXS-673 or equivalent.

- (7) Remove blower and flywheel and coat magneto contact points with a solution of $1\frac{1}{2}$ parts of lanolin, by weight, to $98\frac{1}{2}$ parts, by weight, of carbon tetrachloride.
- (8) Seal all openings in engine with tape, non-hygroscopic adhesive (breather, exhaust part, carburetor intake, etc.).
- (9) Coat all exposed fabric covered electrical wiring with compound, insulation, ignition, U. S. Army Specification 3-182.

PACKING OF RUBBER AND LEATHER ITEMS

1. The rubber item particularly when of the latex type, does not stand up well in the Pacific. Not only is it badly deteriorated by both light and heat but it is freely attacked by insects which quickly destroy its usefulness. For these reasons it should be packaged in "C" dipped package or laminated foil envelope (A-13). This envelope will not, of course, protect the rubber item against the deterioration of excessive temperatures but it will protect it against light and insect attack. With rubber gloves, for instance, it is estimated that they can be packed in lots of one dozen at a cost of not to exceed one cent a pair.

2. Leather items also deteriorate quickly in the Pacific theaters. They mold, mildew and crack badly in addition to being susceptible to insect attack. For these reasons, they too, should be placed inside a "C" Cloth or (A-13) foil barrier. Spores trapped inside the package at the time of closure may, of course, develop into mold, mildew or other fungus growth if sufficient atmospheric moisture is sealed inside the package with them. Under normal conditions of depot packaging, however, the entrapped moisture is insufficient for such development. In every case the wrap should be made to conform as closely as possible to the item or its container so as to entrap a minimum of depot air and moisture vapor.

3. The laminated foil envelope is made in identically the same way as for the metallic item. It may or may not be provided with a desiccant depending on the volume of entrapped air and other parts which with it, may make up an assembly. The straight rubber or leather items will by themselves, seldom be packed with a desiccant.

MIXED BOXES OF MEDICAL SUPPLIES.

1. Mixed boxes of medical supplies should be avoided.

TABLE VII - NARCOTICS & PRECIOUS METALS

<u>Item</u>	<u>Nomenclature</u>	<u>Unit</u>
1009400	Acid, Acetylsalicylic compound with Codeine 1000 tabs	bottle
1048000	Alcohol, Ethyl, 1 qrt USP	bottle
1049000	Alcohol, Ethyl, 5 gal USP	Drum
1049500	Alcohol, Ethyl, 54 gal. USP	drum
1050000	Alcohol, Dehydrated 1 pt USP	bottle
1073000	Apomorphine hydrochloride, 20 HT	tube
1145000	Cocaine Hydrochloride 1/4 oz	bottle
1148000	Codeine Sulfate 1 oz	bottle
1149000	Codeine sulfate, 500 tablets	bottle
1149500	Codeine sulfate, 20 HT	tube
1167905	Dilaudid hydrochloride 20 1-32 gr. HT	tube
1167910	Dilaudid hydrochloride 20 1-16 gr. HT	tube
1181000	Ethylmorphine hydrochloride 1/8 oz	bottle
1223000	Glycyrrhiza & Opium Compound, 1000 Tablets	bottle
1240000	Ipecac & Opium powder 1/4 lb	bottle
1241000	Ipecac & Opium 500 tablets	bottle
1294000	Morphine sulfate 1 oz	bottle
1295000	Morphine sulfate 20 1/8 gr. HT	tube
1295500	Morphine sulfate 20 1/4 gr. HT	tube

5594500	Syringe, dental needle, platino-irridium 23 gage, 1-5/8 inch canula	each
9107000	Cocaine hydrochloride 10 hypo tablets	tube
9115500	Morphine tartrate 5 tubes	box
9115700	Morphine tartrate 1 tube	each

wherever possible. One reason for avoiding this is because mixed boxes of supplies must be opened and the contents separated carefully before storing at the receiving point.

2. However, it is sometimes expedient and practical to pack more than one class of supplies together in one shipping container. A tight pack is essential and if glass items are in the same box with heavy objects, the individual items must not only be packed snugly but must be sufficiently protected individually to guard against crushing, breaking or puncture. Sometimes, certain types of items must be protected against becoming soiled within a box of mixed supplies.

3. All items in a mixed case must be plainly marked so quick identification is possible when the case is opened and adequate packing lists must be placed both inside and outside the shipping container.

QUANTITY OF CLASS 9 MEDICAL DEPARTMENT ITEMS
TO BE PACKED IN AN ORIGINAL (RE-PACK)
CONTAINER.

A - Limiting Factors: Weight - 70 lbs
Size - 4 Cu Ft

AB - Pack in multiples of 12 (Size permitting) plus "A". If size does not permit, pack in multiples of 2, 3, 4, or 6.

SPECIAL PRECAUTIONS WHEN PACKING ACIDS.

The depot packing officer should personally check, prior to shipment, to see: That original packages of acids such as hydrochloric, sulphuric and nitric, be checked for hidden breakage. If caps on acid bottles appear cracked or loose, a new plaster of paris cap must be used.

That five gallon carboys of acid receive minute inspection. The wood protector over neck of bottle must be removed and the stopper carefully examined. Stoppers may have deteriorated during storage and the asbestos, fabric or molded plastic around stopper, damaged. Corroded or defective wires holding stopper must be replaced. A new stopper and asbestos packing may be necessary. Peak neck box covers will not be used. They will be removed and a slatted rectangular cover fastened securely in place.

* PROTECTION OF MICROSCOPE AND OTHER LENSES.

One of the plagues of laboratory workers has proved to be a fungus which grows on and between lenses of microscopes, etching the surface of the glass and eventually rendering the instruments unusable. By inserting a small piece of cotton impregnated with creosote in an out-of-the-way corner of the microscope, the fungus is deterred from growing on the instrument. Microscopes treated by this method remain unblemished for years. Care must be exercised in placing the cotton, as creosote tends to remove the black paint from the metal. Once the cotton is in place, it need not be disturbed for as long as a year, when re-soaking in creosote is necessary. Camera lens and optical lens affected by the fungus also can be protected in this manner.

* See page 33.

LUMBER SHRINKAGE CAUSES METAL STRAPPING TO LOOSEN.

A marked reduction in the moisture content of the lumber in boxes with nailless straps will reduce and possibly eliminate the effect of the straps. As the box parts shrink, the straps will become loose and their potential value diminishes. It has been believed by some persons that loose straps are caused by the strap stretching or the seal slipping. Such stretching of the strap is impossible; the slipping of the seal occurs occasionally, but only in those cases where the seal is not correctly applied.

It is, therefore, the best practice to apply the straps just before the boxes are shipped.

INTERIOR BACKING.

Inside packing serves two purposes. It holds the contents in position so they cannot shift. It also serves to prevent the shocks that may occur from reaching the contents and causing probable damage.

If the contents could shift within the box, the package might be damaged from within. An extreme illustration of this condition would be an iron ball free to move around inside the box. The constant hammering of such loose contents would quickly break open the package.

Frail articles such as pieces of glassware, bottles, electric bulbs, and the like must be protected against outside pressure. Such articles should be packed firmly and yet in such a manner as to prevent the transmission of any pressure to them. Certain commodities, on the other hand, often offer considerable support to the box. They are not easily damaged and do not require individual overwraps.

Articles with legs that might be broken easily should always be supported within the box by suspension strips or blocks. Thus the weight of the article is carried on the more substantial part of the article. These strips or blocks may be fastened by screws or bolts to the unfinished surfaces of the articles or to those parts that are not easily damaged. The suspension strips in turn are fastened by any one of several approved methods to the inside of the box.

The "Flotation" method of packing fragile articles consists in placing the article itself in an inside container which in turn is placed inside of the outer container with loose cushioning material completely surrounding it. This cushioning material is firmly wadded in place and precautions taken to insure an equal and uniform distribution around all sides of the package. This is illustrated in Figure 2.

PROTECTION METHOD OF PACKING

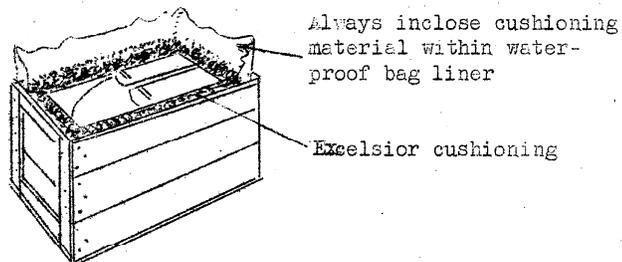

Figure 2

The principles of inside packing of the many items are essentially the same. The particular application to individual examples, however, may vary considerably.

The following methods are applicable for bottles, jars, and all fragile glassware:

Pinch Pack.

The Pinch Pack is ideal for small lightweight items, especially drugs in bottles and jars. The following step-by-step procedure is recommended for easy application.

Figure 3. Place the item to be wrapped on the correct width of corrugated paper. The paper must be wide enough so that the ends of the pack may later be pinched together.

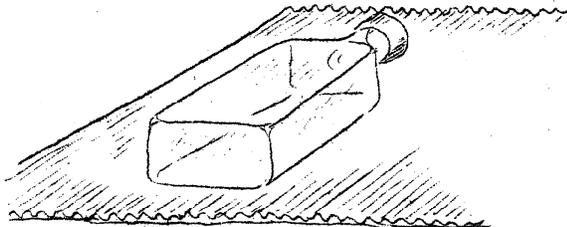

Figure 3
- 114 -

Figure 4. Roll the item in the corrugated paper. While doing so, reverse the end of the paper, as shown in Figure 4, so that the corrugations interlock. This will hold the item tightly in the roll if the tape should slip.

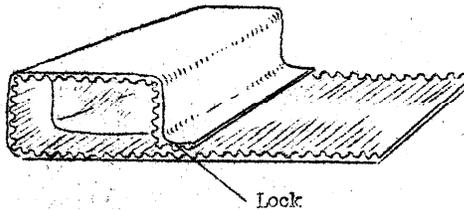

Figure 4

Tighten the roll so that the item is securely locked.

Figure 5. Roll the item in the corrugated paper. Cut the paper so that the end comes in the center of the pack as illustrated in Figure 5. No more than two single thicknesses of corrugated stock are usually required. Extremely fragile items should be wrapped with cellulose wadding before being pinch wrapped.

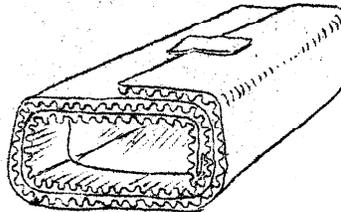

Figure 5

Figure 6. Pinch each end evenly. If the package is under 8" in length, cut a strip of tape long enough to extend $1\frac{1}{2}$ " to 2" over the ends as shown in Figure 6. Secure the package by placing the tape lengthwise beneath each end of the pack and draw the tape around it. On packs longer than 8", cut two pieces of tape and apply as illustrated in Figure 6 (B).

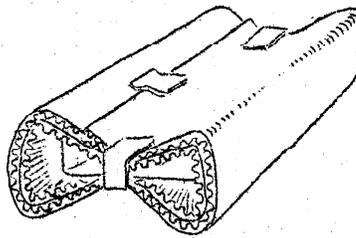

Figure 6

Figure 7. As many as six small items may be safely pinch packed together.

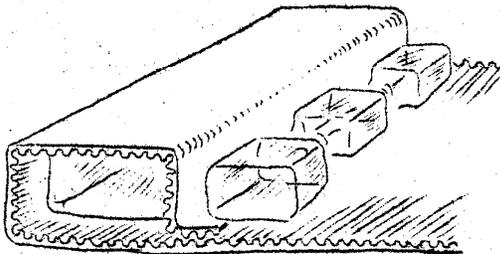

Figure 7

Open Roll Pack.

In general, open roll packs are used when the item is of too great a diameter to pinch pack. It is the preferred wrap for such items as jars, beakers, light bulbs, lantern globes, etc. The following step-by-step procedure will result in a satisfactory open roll pack.

Figure 8. Place the item on a strip of single-faced corrugated paper sufficiently wide to extend at least 1" beyond each end. Cut a slit even with each side of the jar or other item at the required distance from the end of the

corrugated sheet.

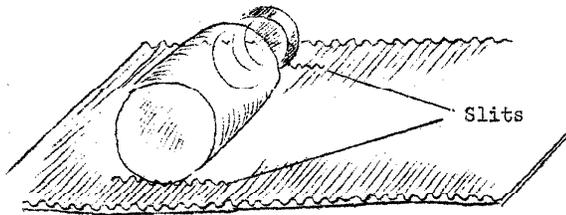

Figure 8

Figure 9. Roll once, making sure that the roll is locked by overlapping the cut end of the corrugated paper on the first wrap.

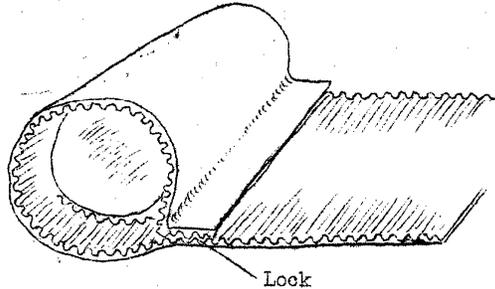

Figure 9

Figure 10. Press in each end of the corrugated paper along the slits previously made, forming a lock across each end of the unit.

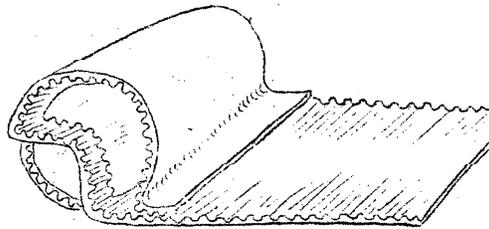

Figure 10

Figure 11. Continue to roll until at least two thicknesses of corrugated paper are wrapped around the item; then cut off and fasten roll with a short strip of gummed tape.

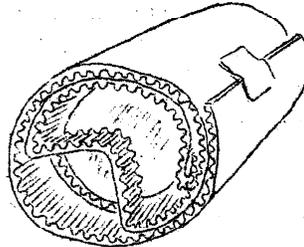

Figure 11

Combination Pack. (Open Roll and Finch Pack).

The use of this particular wrap is desirable when packing liquids in narrow-necked bottles (formaldehyde, alcohol, peroxide) which must remain upright when packed in the outside shipping container. This type eliminates the necessity for the identification of the top or bottom of the item contained in the wrap. In sequence, the steps to take to form this type of wrap follow:

Figure 12. Place the bottle on the required width of corrugated paper.

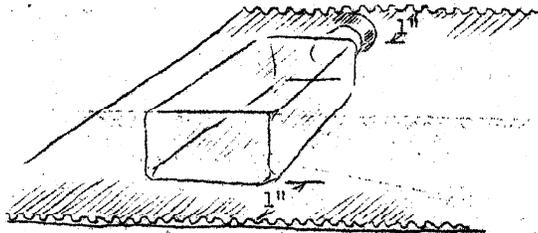

Figure 12

Figure 13. Cut a slit alongside the bottle, bottom end only.

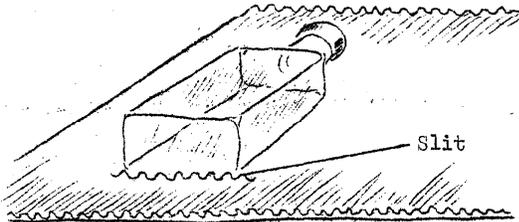

Figure 13

Figure 14. Wrap the bottle in the same manner as previously illustrated for Open Roll and Pinch Packs, taking care to overlap and lock the corrugated paper on the first wrap.

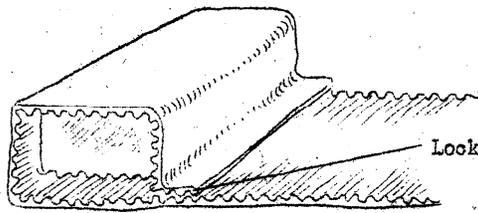

Figure 14

Figure 15. Press in the strip of corrugated paper at the bottom of the wrap where you have previously cut the slit.

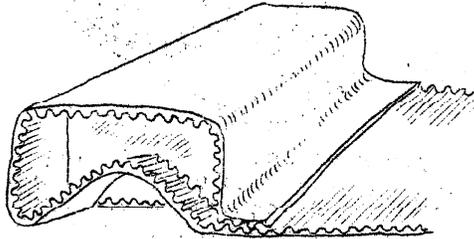

Figure 15

Figure 16. Complete the wrap, making sure that at least two thicknesses of corrugated paper have been wrapped entirely around the bottle. Cut off the corrugated paper and fasten with a short strip of gummed tape.

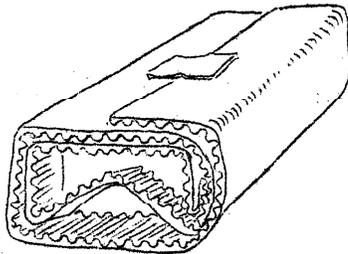

Figure 16

Figure 17. Pinch the top of the wrap as you would for a pinch pack and seal with another strip of gummed tape. This package will stand in an upright position without support and it is unnecessary to identify the top of the package.

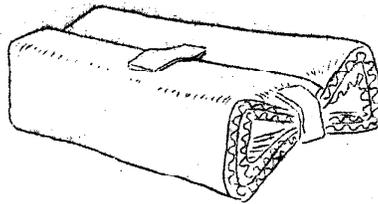

Figure 17

Excelsior Pad Pack.

Excelsior cannot be entirely eliminated in packing. It is especially adaptable to protecting heavy items or difficult-to-wrap, fragile items. It may be used to advantage for 5 pound, 10 pound and 1 gallon bottles. In addition to the pad itself, a small piece of corrugated material wrapped around the neck of the bottle and projecting $\frac{1}{4}$ " to $\frac{1}{2}$ " above it will frequently prevent breakage of the neck. It is made in the following manner:

Figure 18. Form a pad of excelsior and paper of approximately twice the area of the item to be

wrapped. The excelsior should be pulled out into a fluffy layer, approximating 1" in thickness. The pad prevents direct contact with the excelsior and provides a secure cushion around the item.

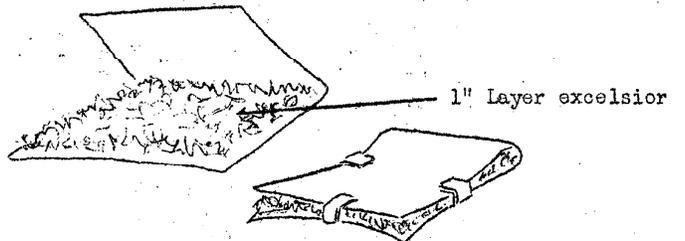

Figure 18

Figure 19. Place the item on the pad thus formed and seal with gummed tape.

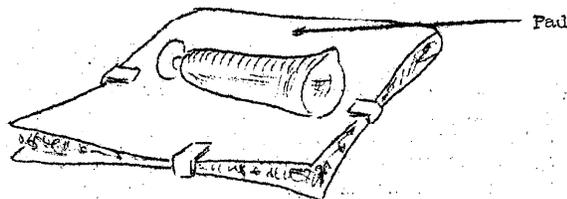

Figure 19

Cellulose Wadding Pack.

This pack is particularly valuable for packing extremely fragile items and is used in and around fragile and delicate parts of many items of medical department apparatus, instruments and equipment. It is especially valuable in packing laboratory glassware and fragile vials. It should not be used as an overwrap for an extremely heavy or bulky item. When used, it is always overwrapped with one of the corrugated packs.

Intravenous fluids should always be protected with cellulose wadding and overwrapped with the Combination Pack. Before closure of the pack, the neck of the bottle should be protected with a narrow strip of corrugated material, pinched about the neck and extending $\frac{1}{4}$ " to $\frac{1}{2}$ " above it.

Package Pack.

This is an effective and convenient method of wrapping small boxes or containers which in themselves do not offer contents enough protection under rough handling. The package pack is made as follows:

Figure 20. Place the object to be wrapped on a strip of single-faced corrugated material of the required width.

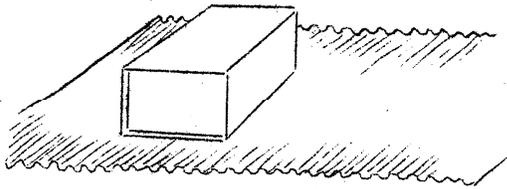

Figure 20

Figure 21. Make one complete wrap around the object; cut off the corrugated material and fasten with gummed tape.

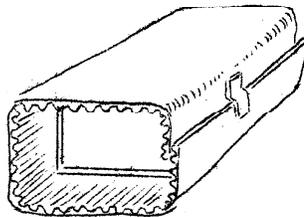

Figure 21

Figure 22. Cut slits in the corrugated paper at each of the four corners on both ends, cutting in as far as the carton.

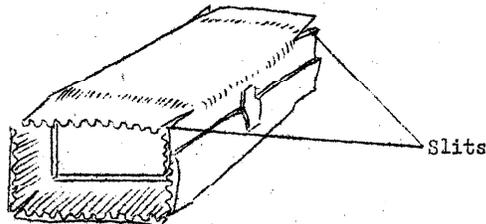

Figure 22

Figure 23. Fold in the end pieces - first the sides and then the top and bottom - and seal with gummed tape. This results in a safe, compact package, the ends of which will be adequately protected with four thicknesses of single-faced corrugated paper.

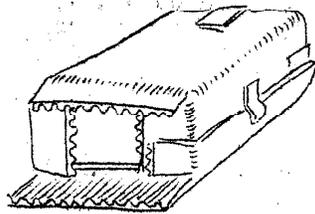

Figure 23

Modified Package Pack.

A modified Package Pack, an excellent and adequate protective wrap for large, heavy bottles, can be used with even better results than the Excelsior Pad Pack. To make this pack requires the use of both double-faced and single-faced corrugated material. First the bottle is wrapped in a sheet of single-faced corrugated material. A sheet of double-faced corrugated is then bent and slightly creased over the edge of a wood box at intervals of about three inches which permits the corrugated material to bend easily around the bottle. Then overwrap with the double-faced corrugated prepared as above. Gummed tape must be used for sealing. Next, slit the double-faced corrugated wrap along the several creases at both ends; fold in the ends and seal with gummed tape. This results

in a sturdy pack that practically guarantees safe delivery of the item. A typical item which might be packed in this manner is item number 1379005, Powder, Developing, X-ray, 5 gallon.

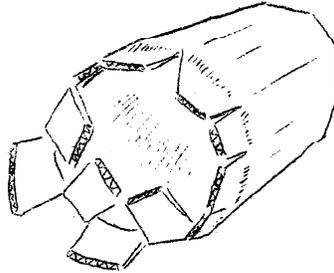

Figure 24

BALING THE MEDICAL DEPARTMENT TEXTILE ITEM

It is the policy of the Medical Department to ship all textile items, wherever possible, in standard bales. Textile items are purchased in baled form wherever the supplier has baling equipment; they are largely baled by the depot where the supplier does not have such equipment. A table listing the quantity by items which the depot should be put into the standard bale is shown on page 74.

Folding For The Bale

All stock must be folded to fit into an area 29" x 14". Large items such as blankets must be folded with a partial layer or ridge along a side and an end but by reversing alternate blankets, a fairly even bale will result. (Insert naphthalene flakes between all layers.) With smaller items such as pajama coats or trousers, folding should be so done that three individually folded garments placed side by side will exactly cover the 29" x 14" baling chamber area. If partial layers have been necessary to accomplish this pattern, alternate layers should be reversed to give evenness of final bale in the same way as described for blankets. Pillow cases will be folded so that either four or six units, placed side by side, will exactly cover the baling chamber; wash cloths will require still a larger number.

Baling Procedure

Before placing the folded textiles in the baling chamber, a sheet of E-2 creped waterproof paper (outer wrapper for bale) and a sheet of No. 2 Kraft wrapping paper (inner wrapper for bale) are centered over the chamber bottom. The chamber is closed, baling boards, a sheet of Kraft paper and a sheet of E-2 creped waterproof paper are now placed over the load and 15 to 24 tons of pressure applied to head, either by electric power or by hand. While still compressed beneath the head, four 3/8" flat steel straps are tightened around the paper-covered bale and seals crimped, two straps being fed through the slotted baler head from one direction, the other two being fed through from the other. The head is raised, the bale is removed from the chamber and inserted into a sewed osnaburg sleeve or burlap waterproof tubing one end of which has been previously closed by means of two 6", 15 gauge wire ties, the cloth having been gathered evenly to form an ear. The sleeve tightens around the bale as its weight pushes down against the closed end, closure is made by means of two additional ties and the tubing is cut off with a sharp knife 3 to 5 inches from the wire tie. No sewing is necessary on this type of operation though one or both ends are occasionally sewed even though the wire ties are used.

Should osnaburg pre-sewed tubing (baling cloth) not be available, a top and bottom sheet can be used, one piece being placed directly on the chamber bottom beneath the paper sheets, the other directly under the baler head, prior to the application of pressure. The use of pre-sewed tubing effects a 20 percent saving in cloth however, and a substantial saving in labor.

Baling Materials

For the information of the depot packing officer, the following details are offered, covering baling materials.

The Pre-sewed Sleeve

The sleeve is made of cotton osnaburg cloth weighing not less than 7 ounces to the square yard or from cotton baling cloth weighing 8 ounces to the square yard. The bias tubing is formed by joining the selvage edge to the opposite edge and stitching. Widths of material used shall be such that the finished tubing, measured flat, is 28 to 31 inches; the degree of bias not less than 40° or more than 50°. It is this bias sewing that gives the tubing the tightening characteristic when pulled longitudinally.

Paper

Waterproof paper used for lining the bales should be Type

E-2, duplexed, creped both directions, as described in U.S. Army Specification 100-14 A (JAN-P-125, when issued). Each piece when formed to the bale shall contain enough material to provide a minimum 3" overlap in excess of one half the bale depth (usually 15").

Kraft paper used for interlining the bales should be Grade B, No. 2, 45 pounds basic weight except that it should be creped to have a 15 percent stretch in each direction. Sheet size should be the same as for the waterproof sheet.

Baling Boards

The four baling boards required for each bale should be approximately 10" in width and 26" long and should test 200 points or more on a Mullen testing machine. They should be bent at right angles along their greatest length, forming an angle piece 5 inches long on each leg. These boards are placed at the bale edges to prevent cutting of the flat strapping into bale contents.

Wires

The wires used for tube closure should be 6" in length, with a formed eye at each end, of approximately $\frac{1}{2}$ " diameter and shall be made of 15 gauge dead soft iron or steel.

Strapping

The strapping used should be of the flat, nailless type, $\frac{3}{8}$ " wide by .020" in thickness and should be of the formed edge type.

Baling Machine Performance

Generally speaking, both the hand and the electrically driven baling machine will turn out the same number of bales per shift. Labor is a more important factor in bale productions, in fact, than type of machines. It is, in fact, reasonable to expect a baling crew to turn out 100 to 150 completed bales per day, regardless of method of bales compression.

Waterproof Adhesives

Most Medical Department depots use EC 164, manufactured by the Minnesota Mining and Manufacturing Company, for sealing both bag liners and fiberboard boxes. This adhesive is pink in color, is easily applied and sets to a "tacky" condition within a few minutes. It has proven quite satisfactory. There are, however, numerous other waterproof adhesives, manufactured by other companies which are reported to be satisfactory for the purposes.

There is no official Army Specification applicable to waterproof adhesive for bag liners. Generally speaking, the adhesive should be free of objectionable odor, develop a good initial tack, be resistant to high temperatures, and, most important of all, have a water resistance approximately 72 hours as measured by water seepage through a 1" seam of an otherwise watertight container.

An official Joint Army-Navy specification (JAN-P-101, Adhesive, Water Resistant, For Sealing Fiberboard Boxes) sets down the requirements of the water resistant adhesive boxes. Type II adhesive (suitable for hand application by brush) in Grades A or B will be the type customarily used by the depot.

A non-adhesive, Insulmastic, manufactured by Insul-Mastic Corporation of America, Pittsburgh, Pennsylvania, though not an adhesive, is used successfully by several of the depots as a water barrier when closing the waterproof bag. It is not an adhesive in that it does not set up. It does, however, prevent the passage of water.

PRESSURE SENSITIVE AND WATER RESISTANT TAPES.

Two types of special tape are recognized as being necessary to the packing, packaging and processing of Medical Supplies for the Pacific Theaters. Joint Army-Navy specifications will soon appear covering each type. The first will be entitled "Tape, Adhesive, Pressure-Sensitive, Water Resistant" the second "Tape, Water Resistant, Gummed".

Tape, Pressure Sensitive

This water-resistant pressure-sensitive tape, will be available in four types, in three grades and nine colors plus a transparent. Type I, with treated cloth backings, is designed primarily for applications requiring high strength and maximum resistance to exposure, rain, sunlight, oil and other deteriorating elements. It is intended for sealing equipment, prepared for amphibious operations, and for sealing the open ends of pipes, valves, and fittings. It may be safely coated with an oil or compound to provide further protection against moisture penetration through the tape.

Type II tape is designed for the sealing and packing of supplies which are overpacked in exterior containers. It should be used wherever the strength of a cloth-backed tape is required. Type III is designed for use in the packing of supplies which are overpacked in exterior containers but which do not require the strength of a cloth backed tape. Type IV tape is similar to Type III in strength properties and is designed primarily as a sealing tape for small, light packages; for holding wrappings in place; for affixing and covering identification labels; and for other light duty requirements.

When used as a label covering, the transparent tape should be prescribed.

Pressure-sensitive tape will not corrode or unduly discolor polished brass, copper, plain carbon steel or aluminum. Grade A, in all types, will have a moisture-vapor transmission rate of not to exceed 1.0 grams per 100 square inches per 24 hours. Colors available will be yellow, light blue, blue grey, white, light grey, red, green, black, and olive drab.

Tape, Water Resistant, Gunned

This tape is designed for the closure of interior water resistant fiberboard cartons complying with Specification JAN-P-108, Boxes, Fiberboard, (V-Board and W-Board, exterior and interior). The adhesive of this type of tape must be activated with a suitable solvent. Complete drying requires approximately 72 hours. A type, now available, is known as Solseal, manufactured by McLaurin-Jones Company, Brookfield, Massachusetts.

PART C

CLEANING, PROCESSING AND PACKAGING OF METALLIC ITEMS

CLEANING, PROCESSING AND PACKAGING OF METALLIC ITEMS

Cleaning, processing and packaging within the meaning of this section applies, primarily, to metallic items within Classes 3, 4, 5, 6, 7, 8, and 9. These may be simple in design such as forceps, a hemostat or a metallic serving tray, or they may be more complex such as an electric motor, cardiograph, sinusoidal machine or oxygen therapy apparatus. In any case, being metallic, they will corrode and frequently become useless unless protection is given. Ferrous parts corrode or rust more easily than do those of most other metals but it should be presumed that all metallic parts, subject to such deterioration. Moreover, unless cleaned, processed and packaged against it, such deterioration will occur not only following the salt water splash of an amphibious landing or the drenching of tropical rains but as the result of high humidity conditions, whether in a protected overseas depot, under an open shed, or even while in depot stock in the United States. Both water and atmospheric moisture-vapor cause corrosion, frequently within a short period of time. All metallic items must be protected against both if they are to be in prime condition when delivered to the user.

IMPORTANCE OF CLEANING

It is not possible to over-emphasize the necessity for thorough cleaning of the metallic part prior to its preservation and packaging. Every simple metallic item must be thoroughly cleaned before subsequent treatment and every metallic assembly, too complex for such cleaning, be at least cleaned of superficial finger-prints on all non-painted and non-enameled surfaces. A fingerprint left on a surface though apparently insignificant in nature, has ruined many a precision or finished part even though that part has been subsequently coated over with compound, oil or other preservative. Once corrosion starts it will continue regardless of such coating. The fact that certain industrial hazards accompany the use of cleaning materials should not prevent proper cleaning or be a determining factor in the application of the proper agent. A great deal of laboratory and depot research lies back of the cleaning recommendations made and the agents used prevents a fire or health hazard.

CLEANING METHODS

Section II, Army Service Forces Manual M-406 outlines several methods of cleaning. Among them, they will serve practically any item used by any service. Generally speaking, however, Sections covering the solvent immersion and brush cleaning method (including wiping), pages 5 and 6, and the removal of perspiration and similar residues, pages 10 and 11, are the ones of primary concern to the Medical Department. These methods are Stoddard solvent for the removal of organic contamination and methanol for the removal of perspiration and similar residues. Either or both may be used as a dip or a wipe. After draining excess solvent from the parts under treatment they must be quickly dried, preferably with blasts of prepared compressed air. They must be similarly dried following immersion in the methanol bath. Should such compressed air be unavailable, a limited

amount of drying can be done by wiping with dry absorptive rags. No matter what the method used, the item being cleaned should always be handled with gloved hands and where cotton gloves are used, these should be kept clean.

PRESERVATIVES

Section IV, Army Service Forces Manual M-406 covers the subject of corrosion preservatives. The depot officer should become intimately acquainted with the preservatives listed and with their use on medical items. Generally speaking, one (1) rather easy removable compound (U.S.A. 2-84), one (1) harder compound (AXS-673) and two (2) lubricating oils are listed (AXS-674 and AXS-777, this latter changed to U.S.A. 2-120. The third lubricating oil shown in M-406, i.e., AXS-702 has been eliminated from use. The compound is applied hot; is rust preventive but not designed for lubricating purposes and may be removed with solvent. The harder compound is applied cold; sets up as its solvent evaporates and is only removable by diligent scrubbing with solvent. The oils are applied cold and easily removable with solvent. For many uses where a hard coating would give excellent protection however, as on the chrome plated door handle and hinges of a refrigerator or the plated indicating gages of water sterilizer, it is psychologically bad to use this dark coloring coating. Where such parts are to be covered therefore, it is much better to use a strip wrap of Grade A, Type I or of Grade C, Type I greaseproof wrapping following cleaning. The light or the medium lubricating oils may be sprayed on prior to such wrapping following cleaning and prior to wrapping.

WRAPPING OR INNER PACKAGING

The proper wrapping or packaging of the medical supply item is, like its cleaning and preservation, extremely important. Indeed, without the proper packaging method, much of the effect of previous treatments may go for naught. Decision must be intelligently made therefore as to whether an item or part should be packaged Method I, Method IA or Method II.

METHOD I (unsealed wrapping) Method I would be used by the Medical Department on contact portions of valves and pipe fittings, non-precision tools of all types, usually in chests, and on trays, pots, pans and other items of mess equipment. With such items the preservative film is depended on to prevent corrosion and the greaseproof, non-corrosive wrapping is applied to keep the preservative in place. A Grade "A" greaseproof wrapping will usually be used for the purpose, the type being dependent on the strength required. Certain parts of the large boiler (Item 9910000) and the portable disinfecter (Item 7791000) will be cleaned and coated with preservative however, following which they will be covered with a greaseproof wrapping to keep a contacting piece of damage from absorbing the preservative. This wrapping will also usually be Grade A, the type being dependent on the strength required.

Method IA (sealed wrapping). Method IA presumes a properly cleaned part and applied preservative which offers adequate protection against moisture condensation from air volume and moisture transmitted through the barrier. The wrapper or the wrapper plus dip coating sealing compound will be waterproof but not necessarily moisture-vaporproof. The wrapping will usually be Grade C, Type I (cloth) and the wax dip is usually used.

Method II (sealed wrap with desiccant). Method II presumes a properly cleaned part but not necessarily a preservative. Most Medical Department items packaged by this method will not, in fact, be given the preservative film because of their complex nature. Most parts of generators, electric ophthalmoscopes, electric otoscopes, sinusoidal machines, cardiographs and eye magnets, for instance, are not suitable for the application of an oil or compound. The method II package must be moisture-vapor-proof as well as waterproof which from the practical operating angle, means that the barrier or wrap must be of the laminated foil or Grade C, Type I (with dip coating sealing compound) types. The Method II package will always carry a suitable amount of silica gel or other desiccant to remove the moisture from the entrapped air, which desiccant should always be purchased and used in dustproof cloth bags. When placing the desiccant it is well to shield it from metallic parts of the item by placing it within an open-end wrap of laminated foil and to tie or otherwise anchor it securely in place. Thus should the moisture-vaporproof barrier be accidentally broken and the desiccant become saturated, it will not lie directly against the metal part and induce corrosion. The Medical Department provides its Method II packages with sufficient desiccant for a 2 year period and the label on the package should show it to carry desiccant and the date against which protection is given.

LAMINATED FOIL ENVELOPES

Many Method IA and Method II packages will make use of the laminated foil barrier to keep out both water and moisture vapor. The barrier sheet is made up in different ways but always, with a thin layer of lead or of aluminum foil as the effective component. In some cases the foil is backed by a sheet of plain or waxed kraft paper; in others by a layer of scrim; in still others by kraft and scrim and in yet others, by spun glass. The under side of the foil layer may, in some cases, carry a sheet of cellophane laminated to it over which there is a heat sealing film may be applied directly to the foil layer. One manufacturer, at least, produces a barrier sheet made up of two layers of foil between which is a layer of kraft paper. Regardless of the sheet makeup, the laminated foil barrier is, generally speaking, an excellent one. Some, in fact, approach perfection against the entrance of moisture-vapor and water into the package.

Selection of Proper Sheet

In the selection of a particular sheet for a particular purpose there are two primary points to be kept in mind. First, if a desiccant is to be used, no sheet of which a cellophane layer is a component part should be selected since the desiccant causes deterioration of this layer. Second,

if the size or weight of the item being packaged is such that it might break through the barrier, notwithstanding cushioning material, carton or other material, used, the scrim backed sheet should be selected. In general, Reynolds Metals Company's A13, A50, or A51 sheets or the equivalents as produced by other manufacturers, will satisfy all Medical Department depot needs. The first embodies a cellophane sheet hence may be used where no desiccant is required and the Kraft backed sheet will give sufficient strength. The A51 sheet is Kraft backed, and embodies no cellophane, hence may be used on packages of moderate size and weight where a desiccant is required. The A 50 is Kraft and scrim backed and embodies no cellophane in its make-up, hence may be used where more sheet strength is required than given by the A51 sheet (While the experimental work behind the recommendations made in Tables I through VI was done on Reynolds products, the ~~Shollmar~~ Products Company, Mt. Vernon, Ohio and the Valley Industries, New York City are suppliers of comparable sheets.)

Classes of Application

The moisture-vaporproof foil barrier may be applied as one of the following:

1. Floating Bag
2. Carton-barrier-carton
3. Carton Overwrap
4. Cushioned Bag

The floating bag type is used on a heavy item such as an electric generator which is bolted to a base. The bag must pass beneath the item, hence the bolts must pass through the bag. Where these bolts pass through the barrier, inside and outside gaskets must be used to make moisture-vapor-proof tight joints. It will usually be best to purchase from local sources, this type of barrier rather than to make it in the depot as perfect fit around the bolts is vital.

The carton-barrier-carton class of applications is one which the depot can seldom use since it does not often have the close-fitting outside cartons necessary. The principle of supporting the foil barrier on the inside and protecting it with the second carton on the outside is however, excellent packaging practice.

The carton overwrap application is probably the one which depots will use most frequently. Certainly, it is the one which will most often be applied where small technical items are concerned. Most of these are received at the depots in cartons or small wooden cases, both of which lend themselves nicely to the overwrap type of barrier. Where a laminated foil barrier is used it is usually made up into envelope form before application.

The cushioned bag (maximum net weight 5 lbs.) will be used on numerous Medical Department technical items requiring cushioning because of sharp corners or edges which might punch through the barrier. Numerous surgical and dental instruments, for instance, will require such cushioning before

the bag barrier is put around them.

Determination of Envelope Size

Determination of the proper size of foil envelope to be made for a particular product may be confusing at first since this envelope, when opened, must form the close-fitting bag in which the item is to be packaged. Presuming it to be rectangular in shape as for instance a boxed dermatone set measuring $11\frac{1}{4}'' \times 7\frac{1}{4}'' \times 6\frac{1}{2}''$ in size, the flat envelope size will be $15\frac{1}{8}'' \times 21\frac{1}{2}''$. The case carrying the item is first measured and the measurements expressed in the order of length, width, and height, the length being the greatest dimension, the width the second largest and the height, the least dimension. Beginning with the three measured dimensions, one calculates envelope dimensions by the two simple formulae:

Envelope wid = case lgth. \div case hgt. \div 2 side seam width \div oversize allowance.

Envelope Hgt. = case lgth. \div case hgt. \div bottom seam \div top fold.
Seam width varies with the weight and size of the item being packaged and heavy items require wider seams than moderate-weight ones. A simple table of side seam widths and of oversize allowances applicable to envelope widths where the item to be packaged is of moderate weight, follow:

:Case Width	Each Seam Width (Top & Bottom)	Allowance	Case Width	Each Seam Width (Top & Bottom)	Allowance	:
: 2"	1/4"	1/4"	20"	3/4"	1/2"	:
: 4"	3/8"	1/4"	24"	3/4"	1/2"	:
: 8"	1/2"	3/8"	30"	1"	3/4"	:
: 12"	1/2"	3/8"	36"	1"	1"	:
: 16"	1/2"	3/8"				:

A simple table of bottom seam and top fold (includes top closure) Allowances applicable to envelope heights where the item to be packaged is of moderate weight, follows:

Case Length	Top Fold Allowance	Bottom Seam	Case Length	Top Fold Allowance	Bottom Seam	:
	Case Height	1/4"	20"	Case Height	3/4"	:
: 4"	2"	3/8"	24"	2"	3/4"	:
: 8"	"	1/2"	30"	"	1"	:
: 12"	"	1/2"	36"	"	1"	:
: 16"	"	1/2"				:

It should be emphasized that seam width as given in the first of the two tables must be doubled since there are two side seams. Also, that when planning an envelope for an item, its opening or mouth should always be along the shorter dimension regardless of box opening. In other words, in spite of the fact that the case opening of the item will usually be along the greatest dimension, envelope opening will be along the lesser one.

Cutting the Foil Sheet

Cutting the laminated foil sheet presents no particular problem since it may be cut from the roll and to size by means of a sharp knife. A slotted cutting table, graduated in inches which permits the cutting knife to project into the slot as cutting proceeds helps greatly in the maintenance of fast, accurate operation.

Taping the Laminated Foil Envelope

Where sharp corners of a case or carton are apt to cut into or otherwise break the barrier, the envelope blank should be taped with a fabric-backed tape while in the flat. Taping will usually be done on the inside of the blank, but where thought necessary, may also be applied on the outside. Application of this tape to the blank must of course be accurately determined and may in some cases, be placed by means of templates.

Heat Sealing Equipment

In forming the envelope the bottom seam should be made first, followed by the making of the side seams. Bottom and side seams are customarily made on an automatic or semi-automatic machine. In making bottom and side seams as well as in closure, both temperature and time of dwell are important factors. Neither individually, nor the combination of the two, should cause separation of sheet components. Closure is probably best done with the pistol grip type of heat sealer which closes two heated irons over the sheet edges much like closing a jaw.

Marking Envelopes in the Flat

To avoid any chance of puncturing the laminated foil barrier, marking should be done in the flat at the time that bottom and side seams are heated. A flat working surface is offered at that time too, and a clean-cut job can be attained.

CHALL C (CLOTH) GAS-LEAK-PROOF WRAPPING WITH WAX DIP

Any of the technical items recommended for Method I, or Method II may be wrapped in "C Cloth" and wax dipped instead of being heat sealed in the laminated foil envelope. It should be borne in mind however, that the foil envelope is more efficient than the "C Cloth" and wax dip as a barrier, the foil being classed as a Type I, the "C Cloth" and wax as a type II barrier. On the other hand, the "C Cloth" and dip package is not as fragile as the laminated foil type of barrier and may be used more

successfully where rough edges, corners, etc. are concerned. Even then however, provided the weight and/or size is unusual or protrusions such as hinges or other hardware are present, padding will be required to minimize the possibility of a break through of the barrier. Where "C Cloth" and wax are used to, an overwrap of Kraft, glassine or waxed paper will always be necessary to prevent the "Blocking" or sticking together of adjacent packages during storage and shipment.

Cutting the Grade C (cloth) Sheet

Cutting the Grade C cloth presents no particular problem. A graduated cutting table can be used to advantage in depot operation and where large quantities are concerned, an electric cutter such as is used in large tailor shops will cut many layers of the cloth at the same time.

Forming the Wrap

In wrapping the C cloth sheet around a carton, care should be taken to follow the procedure shown on pages 40 and 41, Army Service Forces Manual M-406. Seams should be made as lock joints or formed as lap joints with liberal overlap. In making the folds to cover the ends of the carton the bottom projection, (the one opposite the seam), together with sides, should be folded in first. Next, the top, (seamed projection), and sides should be folded in. Finally, the triangular-shaped sides will be folded tightly against the ends. The top and bottom folds should overlap as much as possible and all folds, seams and closures will be made as tight and positive as possible. The operator frequently folds the top flap down first to obviate the necessity of turning the package. This sequence is incorrect however, in that it frequently leaves small channels along the seam for entrance of water. A short piece of hardwood tool handle with smooth rounded corners is useful in making creases and pressing down closures.

The Dipping Operation:

Dipping of the C cloth wrapped package is done in two stages, each side being held in the compound for approximately 5 seconds. There will be an overlap at the center. There should be no air bubbles in the coating layer. Sufficient time must be given between dips for the compound to set but packages should not be permitted to stand for prolonged periods between dips as the enclosed air may cool, then re-expand, forming a discontinuous coating.

The practical range of temperature for a melted sealer bath is between 180° and 210° F. The bath should be held within this temperature range not only because the thinner layer of dip may prove ineffective but because higher temperatures sometimes injure the basic wrapping material. Occasionally, it may even be necessary to slightly reduce the bath temperature below the 180° level. Heating of the bath may be accomplished by means of steam or electrical heat. Flame heating or any method which will not give an even, controlled temperature to all parts of the wax will

probably cause oxidation and deterioration of the compound. Compound, Sealing, Dip coating should conform to the requirements of Ordnance Department U.S. Army Tentative Specification MS-1015, revision 1 Dated 13 March 1944, or, when issued, to the joint Army-Navy specification for the product.

Labels should be applied to the packages before dipping. Should the wax be so dark in color as to make them illegible subsequent to dipping, a strip label of sufficient length to run clear around the package and lap on itself should also be used. The waxed packages will be overwrapped in Kraft, waxed or glassine paper and again labeled.

The Desiccant

All Method II packages must be provided with Desiccant. Silica gel is the material commonly used for the purpose. This desiccant adsorbs the moisture in the entrapped air thus keeping it away from the item and in addition, removes such moisture as, over a period of time, may pass through the barrier wall. Small amounts of moisture vapor will continuously enter the package through the wall and the larger the surface area of barrier wall involved, the more the moisture which will enter. It is for this reason that surface area of package affects the amount of silica gel used. So also, does the length of time for which protection is desired, hence, the standard 2 year period of protection set up by the Medical Department will require four times the desiccant required for a six months period.

The desiccant should always be kept in tight metal containers. Even when being removed from the can and placed in the package the can lid should be tightly replaced after each removal. Moreover, each package should be sealed within two to three minutes of the time that the desiccant is placed, else considerable of the adsorptive power of the desiccant is lost.

The Grade C greaseproof wrapping with dip, being a less efficient barrier than the typical laminated foil sheet, requires more silica gel by weight than the latter. The following formulae may be used to compute the amount of desiccant required from each of the two barriers for a one (1) year period under average conditions of handling and storage.

Types of barriers	Grade A Silica Gel, lbs.	Grade B Activated Clay, lbs.	Grade C Activated Bauxite, lbs.
1 (Foil)	0.15A Plus $\frac{1}{8}$ D	0.225A Plus $\frac{1}{8}$ D	0.30A Plus $\frac{1}{8}$ D
2 ("C" Cloth & Dip)	0.30A Plus $\frac{1}{8}$ D	0.450A Plus $\frac{1}{8}$ D	0.60A Plus $\frac{1}{8}$ D
3	0.50A Plus $\frac{1}{8}$ D	0.750A Plus $\frac{1}{8}$ D	0.100A Plus $\frac{1}{8}$ D

Where A is the area of barrier in square feet and D is the weight in pounds of any dunnage inside the barrier such as corrugated board, cellulose wadding, wooden blocking or wooden case. The above formulae should be used in preference to the one used in Army Service Forces Manual M-406. The resulting amounts will be doubled for two years of protection.

Silica gel which has been used or has otherwise lost its adsorptive ability may be reactivated by heating in an oven until the adsorbed moisture has been driven off. A sterilizer might be used for the purpose.

TROPICAL CONDITIONS

The preparation of medical supplies for shipment to tropical theaters of operation requires the use of more advanced, scientific packaging and packing than has been practiced for the African and European Theaters. In addition to being packed against breakage and in standard units of issue, supplies for the tropical theaters must be especially packaged and packed for open storage in almost continuous rains; against mold, mildew and insect attack and against the ruinous effects of corrosion.

In addition it should be borne in mind that almost every landing made in the Pacific is of the beach-head type. Stocks should therefore be packed for this type of handling. Packs should never exceed 70 pounds in weight where the item will permit and even lighter-weight packs are desirable. They must be waterproofed by means of sealed bag liners or other approved means and must not only give protection against the frequent splashing of salt water and momentary immersion but must in many cases be moisture-vapor proofed as well. Under such conditions the best known packing techniques are none too good. A thoroughly adequate preparation of the item before shipment is vital to guaranteed delivery to the user. The packing officer and the depot must therefore provide themselves with the necessary equipment and supplies to do the best possible job. They must set up a staff of operatives who are constantly and individually alert and aware of the importance of their mission.

RAINFALL AND HUMIDITY CONDITIONS IN THE PACIFIC

Many reports have been received covering the heavy rainfall and excessively high humidities encountered in the Pacific. These conditions are factual and more severe than reported. Some islands have as much as 100 inches of rainfall per year with 18 inches in San Francisco, California, 37 inches in St. Louis, Missouri, 32 inches in Toledo, Ohio, 42 inches in Richmond, Virginia, and 48 inches in Atlanta, Georgia. The number of rainy days per month during 1943 at two known points among these islands were:

	Jan:	Feb:	Mar:	Apr:	May :	June :	July:	Aug :	Sept :	Oct:	Nov :	Dec :
A:	15:	15 :	18 :	16:	22 :	18 :	20 :	19 :	17 :	17 :	14 :	11 :
B:	14:	13 :	13 :	9:	5 :	5 :	5 :	5 :	5 :	4 :	6 :	8 :

Impressive as they are, these figures do not tell the whole story, however, since these rains are followed by a steamy atmosphere as soon as the sun appears. This atmosphere with its high moisture vapor is equally as damaging as rain. Both, combined with the high temperature, stimulate the corrosion of metal parts and the growth of mold, mildew and destructive fungi. These three latter sometimes completely cover the individual

items in a pile of supplies particularly where air circulation is low, keeping the whole in a continuously damp and sour condition. The average relative humidities in percentages at different times of the day encountered over a two months' period at a Pacific installation were:

Month :	0300 :	0600 :	0900 :	1200 :	1500 :	1800 :	2100 :
A :	94 :	95 :	88 :	85 :	81 :	84 :	94 :
B :	95 :	96 :	89 :	86 :	83 :	87 :	93 :

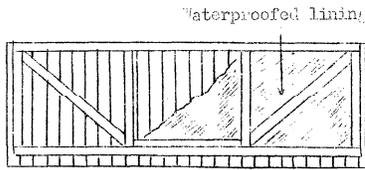

Thus it is seen that reports covering heavy rainfall and excessive humidities are not fictional. Not all islands it is true, are subject to the conditions outlined. When packing for the Pacific, however, the depot never knows where the pack is going or when or where it may be diverted. It must pack for the worst conditions that may be encountered and in a manner that will guarantee delivery in a near-perfect condition whether this destination be New Guinea, Guam or the steaming jungles of Burma.

MOISTURE VAPOR, CORROSION, AND FUNGUS GROWTH

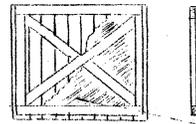

Damage done by rain or salt water spray and methods of averting it are not difficult to picture. Damage done by atmospheric moisture existing as a vapor and the prevention of damage by same, is, however more difficult to visualize. First, it should be realized that every cubic foot of air, no matter where encountered, carries a quantity of invisible moisture vapor. Generally speaking, the higher the relative humidity the higher the absolute moisture (in grains) present and the higher the temperature at a particular relative humidity, the higher the absolute moisture carried. Thus, a cubic foot of "steamy" air at a temperature of 90°-100°F. as encountered in the tropics carries an extremely high amount of absolute moisture, existing as vapor. An exactly similar cubic foot of atmosphere, entrapped within a moisture-vaporproof barrier as packaged by a depot in the United States, would contain a much lower actual quantity of moisture vapor. This same package stored in the theater would thus have an atmosphere with a low absolute amount of moisture (existing as vapor) on the inside with an atmosphere of high moisture content (existing as vapor) directly outside it. The moisture-vaporproof barrier must be depended upon to keep the atmosphere of higher moisture content outside, hence must be perfectly made and sealed.

Corrosion, within the moisture-vaporproof barrier, does not seriously occur until the relative humidity reaches a moderate point. Neither do the entrapped spores of mold, mildew and other fungi germinate until optimum conditions of relative humidity are reached. It is advantageous, therefore, to keep the entrapped air (and moisture-vapor) within the barrier to a minimum if the short circuiting and ruination of electrical parts, the

Figure 25

destruction of wooden cases carrying surgical instruments, and the fogging of optical instruments is to be avoided.

GENERAL REQUIREMENTS OF THE TROPICAL PACK

Every possible protection must be given the tropical pack. It is impossible to do too good a job of packing. Generally speaking, the exterior container should be a fully sheathed nailed wood crate or nailed wood box, depending on the weight and nature of the item. Whichever is used, it must be lined with an adequate and approved waterproof paper, effectively sealed, as the first or water barrier (This barrier will not keep out moisture-vapor). Items subject to corrosion or to fungus or insect attack, such as rubber and leather, should be further protected by packaging within a moisture-vaporproof barrier. In a few cases, such as with simple tools packed in a chest, the item though subject to corrosion, need not be placed inside such a barrier but may be cleaned, covered with a preservative film and wrapped in a greaseproof paper, the function of which is to hold the preservative in place. In such case, the preservative film gives the desired protection by excluding air from direct contact with the part. Many Medical Department items will require, not only a combination of the moisture-vaporproof barrier and film methods but cushioning as well. The depot packaging officer must acquaint himself intimately with all technical details of application and materials within the cleaning, processing, packaging and packing fields and use excellent judgment in their use if the individual packs are to deliver the Medical Department item in prime, immediately - usable condition.

THE EXTERIOR SHIPPING CONTAINER

The nailed wood shipping crate and the nailed wood box, when designed and built in conformity with the provisions of U.S. Army Specification 100-14 ¹, have stood up better in the tropics than other types of containers. It is recommended, wherever any choice of external container is permitted, that one of the two types be used.

The Nailed Wood Shipping Crate

If the weight of an individual item to be packed is in the neighborhood of 400 pounds or more, as are many items of x-ray equipment, the boiler, the field disinfectant, etc., it should almost certainly be packed within a fully sheathed, nailed wood crate. Further, if it is important that the individual item be shipped in an upright position, presuming it to be reasonably large, use of the nailed wood crate as the external container will frequently go far toward assuring this during the handling and shipping. The skidded crate has seldom been seen at Ports or other points in other than a vertical position.

Crate Prefabrication

The most economical method of building crates is to prefabricate them in the depot shop in advance of actual use. In this way, large machine

runs of individual parts may be accomplished and line production incorporated. Further, with prefabricated crates, assembly itself may be made a line operation and confusion otherwise attendant, entirely eliminated.

When panel member sizes have been accurately figured and the parts cut, the panels themselves may be assembled on jigs on benches. In this manner every panel of a type will be identical. The typical nailing pattern will conform with that shown on page 31, U. S. Army Specification 100-14 A; all nails will be clinched and in all other respects, a first class job be done. In order of assembly, frame members will be placed in the jigs on the bench, the sheet of waterproof paper layed down and the sheathing placed over the paper. When the nails have been driven through, the panel must be turned over and all nails clinched (or checked for proper clinching if assembly table has a metal bed). The waterproof paper sheet should be cut to project over each of the four panel edges by approximately 1", this overlap being allowed for turning and waterproof sealing at the crate corners. Lines should be drawn across the face of the sheathing layer prior to nailing to show the bench worker the positions of frame members.

Structural Requirements

Certain basic structural requirements should be met in the fully sheathed crate, regardless of size or weight. First, skids must be placed at extreme outside edges of floor of crate and sheathing of side panels must be securely and adequately nailed to them. When grab hooks are used on the top of the crate, the sheathing lifts the skidded-floor which carries the load. Second, the crate top must be adequately cross-braced against crushing when the grab hooks tighten and lifting is begun. It is to resist this potential crushing force that wooden members are set in between side panel tops in addition to top-panel frame members. It is imperative that nailing at all corners and edges be adequate.

Crates will be lined with E-2 waterproof paper and topped with E-1 paper as described in Ordnance Department U. S. Army Tentative Specification AXS-1246, Revision 1 (until superseded by JAN-P-125, Barrier, Material, Waterproof). Paper projections will be turned at crate corners and waterproof adhesive or other barrier applied to make them absolutely watertight.

Internal Bracing and Blocking

It is particularly important that the crated item be well blocked and braced against movement of every type during handling and shipment. The greater its mass the better the job which must be done and it is seldom possible to install too much blocking and bracing. Considerable information regarding blocking methods will be found on pages 47 and 48, Army Specification 100-14 A and in the new JAN specifications when it appears. Bracing should be so installed, wherever possible, in such manner as to require the smallest number of waterproof barrier punctures. Where necessary to pierce it, a dab of adhesive around the hole will frequently close the spot to breakage.

THE NAILED WOOD BOX

For packs weighing under 400 pounds, the nailed wood shipping box is nearly always the container to select. For weights from 200 to 400 pounds it is usually best to use style 2, 2½ or 3 box though when evenly loaded, these are normally used for greater weights. For weights under 200 pounds, a style 4 box is nearly always the container to use. These boxes may be built of sizes and thicknesses of lumber shown in tables 13 and 14, pages 62 and 63 Army Specification 100-14 A (JAN-P-106, when issued). In Medical Department usage the thicknesses shown are usually disregarded, however, and the standard 25/32" thickness of lumber is used because of more ready availability. The use of the thicker lumber for wood boxes is particularly desirable where termite attack with its weakening effect is present as in the tropics and where bottles, glassware and other fragile items are being carried.

Strapping and Stapling (See figure 1, page 110)

Strapping of the nailed wood box is important. Proper stapling is paid equally important. Overseas reports have shown proper stapling to have dividends where staples have been placed every 6". No box should be permitted to go unstapled. Staples must not, however, be permitted to pierce the inner surface of the box else the bag liner will be punctured and rendered useless.

Either wire or flat strapping may be used on wooden boxes, provided it meets the requirements of Army Specification 100-14 A (JAN-P-106, when published). Straps must be positioned one-sixth the length of the box from each end; be placed at right angles to top, bottom and side edges and bite into the wood at all four corners.

THE BAG LINER

It is particularly vital that every box shipped to the Pacific be provided with an adequate waterproof bag liner. Without such liner, the item carried will immediately become wet and subject to corrosion or fungi attack, depending on its characteristics. All metals must be presumed to be subject to corrosion; cellulose products such as paper cups, toilet paper, etc., are quickly subject to decay and rubber items are attacked by insects. Even glass is fogged by the mycelium of a fungus.

To be effective, the bag liner must be perfectly sealed with waterproof adhesive and perfectly constructed. It must be made from one of the waterproof paper types approved in Ordnance Department U.S. Army Tentative Specification MS-1246, Revision 1, dated 24 June 1944 (JAN-P-125, when issued). The 30-30-30 sheet has long since proved itself unsuitable for bag liners. Such sheet is not on the approved list; it should not be used.

Wherever possible, waterproof bag liners should be purchased to fit the box. There are many times, however, when this will not be possible. In such cases, bag liners must be made at the depot. The following procedures

may be followed where depot manufacture is necessary.

Depot Manufacture of Bag Liners

Frequently it is necessary for the depot to make a special size of bag liner. There are numerous ways to make such liners. The following describes the manufacture of a simple design of bag liner:

Figure 26 Measure the inside dimensions of the box in inches.

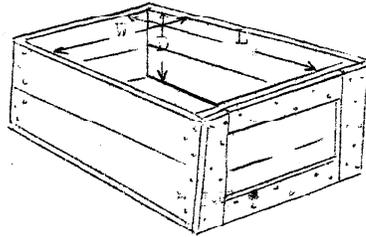

Figure 26

Figure 27 Cut a sheet of waterproof paper to the following sizes: Length--- $2\frac{W}{4} + 2D + 8$
Width --- $\frac{W}{4} + L + 4$

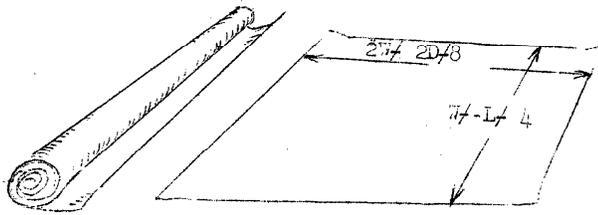

Figure 27

Figure 28 Fold and crease the sheet at the middle of the length, a; crease the sheet 2 inches from each side: edge at b and c.

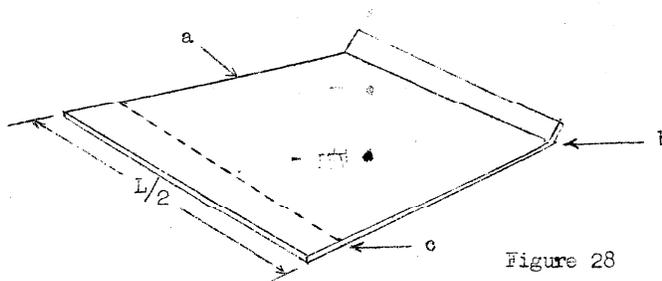

Figure 28

Figure 29 Unfold the sheet and apply waterproof adhesive to both 2-inch margins.

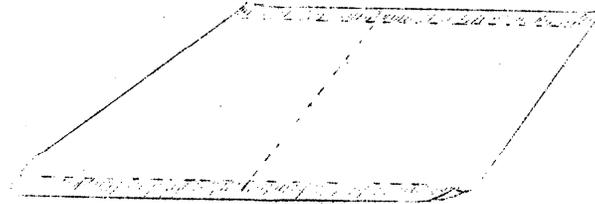

Figure 29

Figure 30 Refold the sheet at all creases and apply a pressure of 10 to 20 pounds per linear foot to the margins while the adhesive sets.

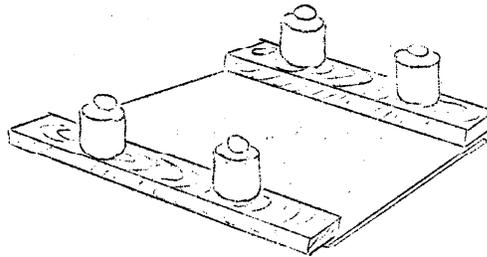

Figure 30

Figure 31 Crease the sheet at distance $\frac{1}{2}$ width of box. From each of the 3 creases made in Figure.

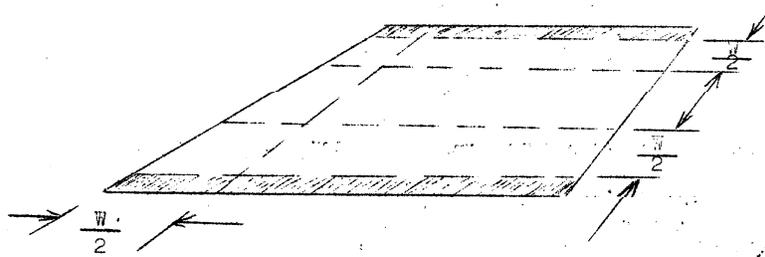

Figure 31

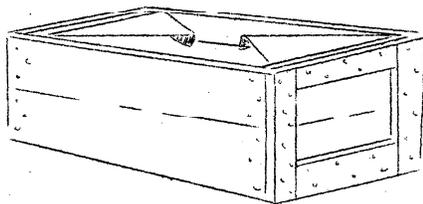

Figure 37

DEPOT CLEANING, PROCESSING AND PACKAGING LINE SET-UP

The processing section will of necessity become one of the most important and busily engaged sections of the processing installation. Here all metallic items, both large and small as well as units requiring some protection against tropical humidities and which will be moved into the center section of the processing section for needed applications, will flow. This processing should take place immediately after installing line set-up. Assemblies can be built far more rapidly from stock already processed before required assembly phasing-out and advance processing therefore is desirable.

The drawing represents a true-scale presentation of one approved type of processing line set-up. Additional tables and available space may necessitate certain changes but the overall flow would nevertheless be as presented. Personnel requirements likewise must be mobile as otherwise bottlenecks may develop at certain sections of the line which with proper personnel disbursement can very easily be avoided. The purpose of the drawing is to provide a graphic illustration of how the line may be constructed and to facilitate operation and expedite the actual function this section will perform.

In selecting the location for the processing section, the important thing to consider would be its proximity to the carpenter shop section. After processing, the assembling of pre-fabricated crates about larger Medical Department items, should in all cases be carefully supervised by processing section personnel as well as carpenter personnel. A better understanding of processing requirements which might be needed after blocking by the carpenters and fastening of the unit to its base would prevent otherwise inadequate or destructive operations before shipment. Likewise, unnecessary and difficult movement of large units to and from the carpenter section is thus avoided. After crating and completion of inspection by processing section personnel, the unit could move either to the warehouse or to packing section for marrying into assembly being built at the time.

An explanation of the numbered units of the processing line set-up follows:

1. - Baskets for dipping of instruments and other adaptable items will be provided. These should move down the conveyor line on a wood tray. The trays should be constructed by the carpenter shop to fit the base of the basket. The trays provide better mechanical movement and prevent drippings and dirt from falling to the floor. After completing circuit of the line all trays and baskets should be thoroughly cleaned and dried before being used again. The size of baskets will be approximately 18" x 16" x 4 $\frac{1}{2}$ ". Racks which can be constructed by carpenter section personnel may be more suitable for the dipping of other items and can be constructed as practice indicates the advantage of their use.

2., 3. - These are sorting and control tables upon which the instruments and

other items for processing will be placed before flowing down the line. Here the operator will check to see that if for instance a basket might contain only one item number, a tag of identification is placed on the particular basket; if a mixed assortment of instruments or items, separate tags are placed on each unit for identification. Likewise if any problems might arise concerning proper preservative or type of material barrier to employ, instructions should be provided the operator concerned at the time.

4., 5. - These tanks are provided for Stoddard Cleaning Solvent. The items to be cleaned are cold dipped. The second tank, 5 is provided for a more thorough rinsing operation before drying.

6. - This is a table for a quick compressed air drying which blows off most or all of the solvent inasmuch as 110 lbs per sq. in. pressure is expected to be provided.

7. - This tank is likewise unheated and will contain Methanol Cleaning fluid. This cleaner will remove salts and perspiration and finger prints which the other cleaning dip will not.

8. - This table like table 6 will be for compressed air gun drying.

9. - From table 8. the baskets will flow through an oven which must be constructed by each processing installation. Suggested method would be to use sheet metal for body of oven to be insulated with asbestos material and with two spring doors at either end where conveyor would enter oven. The oven length should be about 6' and wide enough to permit easy passage of items along conveyor within. An air draft should be provided at top to prevent any pressures from building up inside since temperature of oven should be maintained at approximately 350 to 400 degrees Fahrenheit during operation. The oven would provide complete, effective drying of items before preservative dipping which should take place immediately thereafter. No items should be oven dried and then allowed to stand for any period of time. Light bulbs will be supplied for heating source, 110V-60 Cycle, 1000 watt. These should be spaced along top and sides of oven in proportion necessary to hold above temperature for efficient operation.

10., 11., 12., & 13. - Represent dipping tanks for preservatives after cleaning and drying has been completed. Tank 10 could contain Compound, Rust Preventative, Thin film AXS-673. This particular preservative has its limitations and would be mostly for rougher type, unfinished metallic parts where removal of preservative would generally not be necessary. However this compound is especially useful for protecting metallic surfaces not adaptable to wrapping to hold the preservative in place and also where protection is desirable while using apparatus in the field. One example would be Spokes on Carrier wheel, collapsible where long storage might otherwise result in rusted and useless apparatus when issue was finally made. Applied Cold.

TANK 11 could contain Oil, Lubricating, Preservative, Medium, AXS-674.

This is likewise a cold dip tank. This preservative is particularly useful and is excellent for dipping of practically any instruments, including box-lock instruments. After oven-drying, instruments are slightly above normal room temperature and this medium oil preservative forms about an ideal coating and affords perfect protection against corrosion.

Tank 12 could contain Compound, Rust Preventive, Light, USA 2-84. This is applied hot and requires a heating element under tank. Instruments may likewise be dipped in this preservative which is an ideal rust preventive compound but simple instruments or parts without box-lock joints or moving parts are more adaptable however. Hold temperature at about 155 to 180 Fahrenheit, varying the temperature to suit the thickness of coating desired.

Tank 13 could contain Oil, Lubricating, Preservative, Light, USA 2-120. This is a very thin surfacing oil preservative and is not as effective a rust preventive as XS-674 for instance, but is particularly good for chrome-nickel alloys and highly finished metallic surfaces upon which an extremely thin film would be sufficient and perhaps desirable. Other preservatives than these principal four will be used as for example an oil preservative for spraying electrical wiring as on a cyclotherm. The four tanks will provide the main sources for preservatives for corrosion prevention of most Medical Department items.

Tables 14 and 15 would handle the entire flow of instruments after they had progressed down the line and had received the proper preservative dip. These tables should be built about 30" high so benches could be constructed to enable the operators to be seated around. Here the Grade A material or aluminum foil would be cut to proper size, the tag removed from the instrument to be wrapped if tagged, and the instrument wrapped in the Grade A material or foil. Here also the proper item identification labels should be selected and likewise the closest fitting cellulose envelope. Then the instrument, properly wrapped together with correct identification should be inserted in the envelope and placed back in the basket and sent along the line. (All envelopes would be heat sealed between tables 17 and 19 at sealer, heat, rotary which will be bench mounted and is excellent for a fast, volume operation such as this). On these tables, trays should be provided so neat, orderly and effective stock-piling of identification slips for the different instruments mimeographed in advance could be arranged. Also, cutting knives should be handy to cut the required sizes of Grade A material or foil which preferably should be on rolls beneath the table used for cutting and be pulled up through a slot in the table. In addition to separate knives for cutting which will be provided each installation, it is contemplated that one knife, paper cutting with 24" blade and one knife, paper cutting with 36" blade will also be useful. Trays arranged in order of envelope size should likewise be made for adequate stocks of instruments envelopes and placards with sizes plainly marked neatly tacked on for convenience and orderly handling.

Table 16 will be a cutting table with slots arranged about every inch of surface running in both directions so cutting is greatly facilitated. Rolls

of laminated foil materials, Reynolds Metals' 4-19, 4-50 and 4-51, are conveniently handled from a rack built by the carpenter section which should revolve about a base standing perhaps three feet above floor level. The desired roll of paper can then be drawn over end of table from the rack to length necessary for cutting. An alternate method is to build racks at both ends of table and merely draw material desired down over table when cutting. One knife, 36" blade and one knife 24" blade might prove useful for smaller sheets. These Butvar barriers offer the finest protection possible for Method II Wraps and most electrical items or technical units requiring inclosure of desiccant should normally be routed by here for proper-size barrier to be cut.

Table 17 - This table would be the heat sealing table and marking table of the laminated foil sheets while still in the flat. All seams excepting the top seam could be sealed at this point. Equipment necessary would be on sealer, jaw type, bench mounted and about 4 sealers, flat, hand type. Likewise marking roller device should be provided for adequate identification of unit by item number, nomenclature, unit and quantity to be inclosed within barrier. The sealed barrier would be placed in the basket and moved along to table 19.

18. - This is a sealer, heat, rotary, bench mounted for fast, volume operation as on instruments.

Table 19 - Here the item or items would be inclosed within the barrier and desiccant inclosed where Method II Pack was indicated. The top seal would be made at this table. If desiccant is inclosed, label must be placed on outside of barrier showing this fact and approximate period desiccant will provide protection. Tape must be neatly applied along all corners and seams for reinforcement wherever necessary. Equipment at this table should include one sealer, jaw type, bench mounted and 2 sealers, flat, hand type, and labels to be used when desiccant is inclosed.

20., 21. - Packing benches are provided for here as all processing of items will have been completed at this point as well as careful inspection of all unit packs. Then OP's can be built and unit packages packed within waterproof barriers with cushioning gunnage and inclosed within a road box.

22. - Scale for weighing of boxes.

23., 23a., & 23B - These three tables are cutting tables for all Grade "C" Cloth. Approximate height should be 30". Likewise slots running in both directions as table 16 will greatly facilitate the cutting operation.

24., 24a. & 24b. - These tables are for the wrapping of the "C" Cloth about the unit, inclosure of desiccant should Method II packs be routed this way for any reason, and in all cases label with item number, nomenclature, unit and quantity is pressed on "C" Cloth wrapping before the dipping operation which follows. 24" height is suggested for these tables.

25. & 26. - Five and one gallon tanks respectively for Compound, Sealing, Dip Coating, MS-1015. The temperature of this compound for dipping of "C" Cloth wrapped packages should be about 180 degrees Fahrenheit for a smooth, even coating.

27. - This revolving table can be constructed by the carpenter section. Its advantages over the stationary table are that after dipping slightly more than half of a "C" wrapped package, the operator sets it on the revolving table. This procedure continues with each successive package until the original package dipped, again reaches him. At this point, the wax is cool enough for another final application. By the time the completely dipped package reaches the conveyor line extending between the two over-wrappers, it is about ready for overwrapping.

28. & 28a. - These tables are where the Kraft overwrap is made over all "C" dipped packages. Likewise all overwraps are plainly marked as to item number, nomenclature, unit and quantity. Roller-type stamp sets should be provided these operators for stamping while in the flat as is also suggested for table 17.

29. - This is a cutting table for larger sheets of grade "C" cloth for the larger units of equipment.

30. - This is a wrapping table conveniently located for larger units at center section of processing line.

25a. - This is another five gallon tank for dipping of "C" packs or for brush application to "C" cloth wrappings on larger units in center section.

26b. - This is a one gallon tank for brush application of MS-1015 to "C" cloth wraps on units in center section.

31. & 32. - These two tables are for the stencil cutting machines which should include one 7/8" cutter and one 1-3/4" cutter and other supplies and equipment required for the marking, banding and stapling and other boxing operations. Careful inspection should take place always before any "C" dipped packages or Laminated Foil or instrument packs ever reach the packers at 20 and 21. Likewise another careful inspection and a final one before any unit or box or crate leaves the processing section should always be made and a useful SOP would be for the personnel of the final inspection to have the authority to permit removal of units from the processing section alone.

33. - There must be provided ample fire-fighting apparatus on a centrally located stand close by the volatile liquids stored in open tanks. The possibility of fire is present at all times and no line should be placed into operation until a rack with fifteen or twenty fire extinguishers is set up and periodic inspection of extinguishers made from time to time. (Ventilating fans should also be provided for, to eliminate vapors which arise from dipping tanks in an operation of this nature).

The processing section as outlined will normally process metallic, unfinished parts but there is a need for processing items subject to the devastating attacks of mold, fungi and insect attack as well. Items of this nature include rubber gloves, leather items and even certain optical lenses. Likewise, some Class 2 supplies which must be absorptive as well as sterile at time of use when inadequately packed in OP's which do not provide needed protection must be broken down and repacked. Most all of this type of item will take a Method 1A pack and flow down the "C" cloth and dip line in the assembly.

The set-up of the line as illustrated suggests the personnel required. This line should be set up as quickly as arrival of necessary tools, equipment and supplies permits and put into immediate operation.

ADDITIONS AND/OR CHANGES IN PACKING MANUAL.

As additional sheets are received for packing manual, the pages will be numbered consecutively starting with page 155. Part "D" of manual will be eliminated and any maintenance information will be issued under separate cover.

Cross reference should be made in ink as part of index or typed in neatly and likewise on all pages wherever indicated at time of attaching additional sheets to manual proper.

BED AND MATTRESS "SANDWICH PACK" REQUIRED FOR UNIT ASSEMBLIES (Ref pgs 61 & 66).

1. Two mattresses, waterproofed and strapped between two beds will be the Medical Department policy for overseas packing of mattresses and beds of hospital assemblies. They will be packed as follows:

2. Two mattresses, full length, shall be rigidly tied together with two ply twisted jute, sisal or other suitable cord having a tensile strength of not less than 268 pounds. The cord shall be applied in one piece so as to divide the length of the package into four and the width into two equal segments. A secure knot shall be made at each cross-over of the cord.

3. Inner Paper Wrap - Mattress pack shall be wrapped in Kraft paper. Wrap shall consist of not more than two pieces with edges overlapping not less than 5" along length of pack and girthwise around pack, both overlaps to be securely taped with 60 pounds (Grade B), basic weight, 2 $\frac{1}{2}$ " or 4" width, gummed Kraft paper. Ends of Kraft sheets shall project not less than 16" beyond ends of mattress pack when pack is placed on them. After forming wrap around mattress pack, sides of end projection shall be folded in first, then bottoms and finally tops folded down to form neat, tightly compressed ends. These shall be taped into position with gummed Kraft-paper tape as specified above.

4. Outer Wrap - Outer wrap shall consist of Tubing, burlap, laminated, waterproof, 76" circumference. Nine (9), feet of waterproof tubing is required per wrap and therefore 4,500 linear feet per 1,000 beds. Two twelve inch (12") wire ties at each end will hold end folds firmly in place and complete wrap seal.

5. Sandwiching Between Two Beds - Lay one bed down with legs folded and on top. Place mattress pack on top. Insert fiberboard strips or at least two layers of single faced corrugated between mattress pack and mosquito bar holders on the leg braces of bed. Place another bed, legs folded and inward, against mattress pack taking care again to protect pack from pressure of mosquito bar holders on the leg braces. The unit will then be strapped with 5/8" steel banding, using three equally spaced girthwise and one longitudinal strap. Caution will be observed that the mattress pack is evenly placed on the beds on all sides before the unit is strapped together. Also, on all points of contact between straps and edges of beds, provide fiberboard or cardboard cushion. Straps may then be cinched tightly without fear of snapping or slipping. When completed this pack weighs about 150 lbs and is more conveniently handled than the usual mattress bundles.

SEPARATE MATTRESS SHIPMENTS (Reference pgs 61 and 66).

1. When only mattresses are being shipped, four mattresses will be separately waterproofed as previously specified. However, in lieu of waterproof paper, tubing, burlap, laminated, waterproof is recommended because of its more effective durability as well as speed of packing. When wrapping pack of four mattresses, 108" circumference tubing is required. Nine (9) feet of tubing of this dimension is needed per pack and therefore 2,250 linear feet of tubing per 1,000 mattresses.

ITEM 9955500, STOVE, TWO-BURNER, GASOLINE.

1. Remove burners and unscrew fittings from tank. Empty all fuel and thoroughly exclude any fumes from tank by directing compressed air spray into tank.

2. After thoroughly cleaning and drying, immerse fittings, needle valve and control valves in Oil, lubricating, preservative, light USA 2-128 and replace on tank, carefully wrapping around immersed parts with either Grade "A" material and holding in place with tape or with Grade "C" cloth and sealing by brushing on wax.

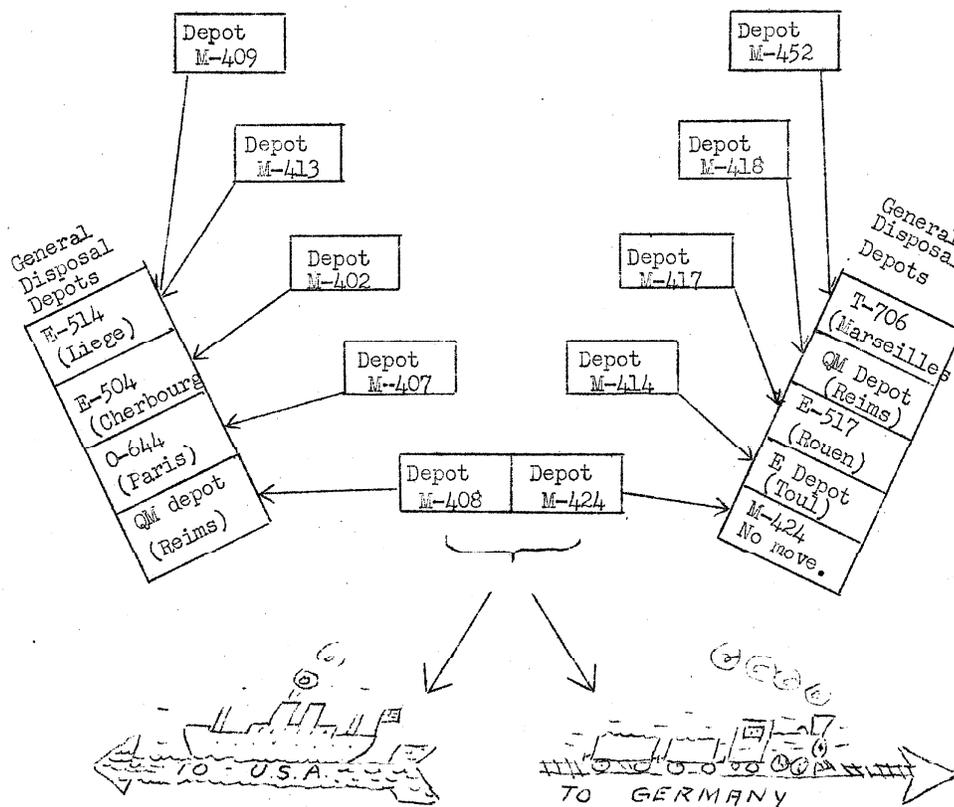

3. Clean, dry and immerse the two burners in USA-2-84, Compound, rust-preventative, light, wrap in Grade "A" material and pack snugly alongside tank, nesting in cellulose cushioning.

4. Repaint all surfaces requiring refinishing.

5. Wrap entire case in Grade "C" material and dip in KS-1015 for method I-A pack, wrap in Kraft paper with proper identification and pack snugly within adequate wood box.

SCHEMATIC PLAN
OF

Disposition of stocks of Medical Supply in Liberated Countries
and the United Kingdom.

The plan above, is more than a plan. Its an operation that is well advanced, ie-

- a. TSDs have been issued covering stock to be returned to the US in conformity with TM 38-420. Many shipments are being called to ports and out shipment.
- b. Stocks for occupational levels of Occupation Depots are being moved.
- c. Levels of maintenance stocks for the three continental Depots, M-407, M-452 and M-418, charged with distribution mission in liberated countries until the conclusion of personnel re-deployment, are either on hand or intransit to these depots. This also applies to M-424 in the UK.
- d. Stocks of surplus property at depot M-402 have already been moved to General Disposal depot E-504. Surplus items are also in process of movement to other General Disposal Depots.

The chart above is intended to indicate the three way drain of Medical depot stocks. 1. To occupational area. 2. Return to US. 3. To General Disposal Depot concentration points after having been reported to A&NLC as surplus. The operation of General Disposal Depots is not a chief of Service responsibility. Once items are reported and moved to these depots the final disposal is one of Sale and the responsibility of the A&NLC.

R.L.B.

SECTION IV

ISSUE OF SUPPLIES AND EQUIPMENT

1. Organization
2. VE Day to VJ Day
3. VJ Day to 30 Sep 1945
4. Transfers of Unit Assemblies

1 Exhibit - Status of Major Hospital Unit Assemblies

1. ORGANIZATION

During the military operation Issue Branch, Supply Division, Office of the Chief Surgeon, was divided into three sections:

- a. Requisition Section
- b. Catalog & Equipment List Section
- c. Hospital Unit Assembly Section

2. VE Day to VJ Day

As of 8 May 1945 the Catalog and Equipment List Section was absorbed by the Requisition Section due to the immediate decrease in the activities of the two sections upon cessation of hostilities in this Theater. Since 12 May the Requisition Section, in addition to processing requisitions for medical supplies, has been primarily engaged in the preparation of Theater Shipping Orders for surplus supplies being returned to the United States. Theater Shipping Orders are prepared listing the items, quantities, shipping port, and overseas address of consignee. The Shipping Orders are forwarded to a Medical Depot for packing and shipping to the designated Port. Records are maintained on each shipment from the preparation of Theater Shipping Order to the loading of the shipment aboard the ship, and appropriate reports are submitted to G-4 of all phases.

3. VJ Day to 30 Sep 1945

Upon cessation of hostilities (VE Day) the activities of the Hospital Unit Assembly Section were reversed, and instead of directing the receipt on the continent of Hospital Unit Assemblies, the Section became immediately engaged in building and redeploying hospital and other unit assemblies on the continent to the Pacific area and disposing of them thru Lend Lease to Foreign Governments. A total of nineteen, 1000-bed General Hospitals, five 750-Bed Station Hospitals, two 500-Bed Station Hospitals, and three 250-Bed Station Hospitals, unit assemblies were redeployed to the Pacific area from 8 May to 30 Sep 1945.

4. Transfers of Unit Assemblies

During this period the following unit assemblies were transferred to Foreign Governments as indicated on Lend Lease: (See par 1, attached Exhibit 1, "Status of Major Hospital Assemblies")

- 3 1000-Bed General Hospital Unit Assemblies to Netherlands Government
- 8 1000-Bed General Hospital Unit Assemblies to Belgian Government
- 17 1000-Bed General Hospital Unit Assemblies to French Government

The Contracts for the Netherlands and Belgian Governments have been completed. The French Government requested a total of fifty 1000-Bed General Hospitals leaving a balance as of 30 Sep of thirty-three General Hospitals to be turned over to the French Government, which will be transferred at site of operation when the hospitals are closed and no longer required by U.S. Army (See par 2, attached Exhibit 1, "Status of Major Hospital Unit Assemblies") At present there are eleven General Hospitals in U.K. Depot M-424, and fourteen General Hospital and one 500-bed Station Hospital Unit assemblies in Depot M-452, Marseilles, which are being declared surplus and will be used to complete the contract for the fifty General Hospitals to the French, if needed before the required balance of thirty-three are closed on the continent. If not required for this purpose, these assemblies will be referred to Army Navy Liquidation Commission for disposition as surplus property.

SECTION V

FINANCE ACTIVITIES

1. Considerable activity took place in the Finance Section in the period from 8 May 1945 to 30 September 1945. At the beginning of this period records concerning British Lend Lease, French, Belgium, Luxembourg, and the Netherlands Reciprocal Aid, Lend Lease and local procurement activities were kept in this office at AFO 887. Records of British Reciprocal Aid and United Kingdom local procurement were kept at the Surgeon's Office, Hq UK Base, AFO 413.

2. In effect 8 May 1945, for field procurement by U. S. Forces in the liberated countries, i.e., France, Belgium, Luxembourg, and the Netherlands, were ETO-SCF's 10F, 10B, 10L, and 10N respectively. In the UK Base, local procurement of medical supplies and equipment was made in accordance with Cir 28, Hq ETOUSA, 1 March 1944, and Technical Bulletin No. 27, as amended, Office of the Surgeon, Hq. UK Base.

3. On 26 May, the General Purchasing Agent published Part I of Manual No. 1 entitled "Field Procurement in Liberated Areas," which rescinded ETO-SCF's 10F, 10B, 10L, and 10N. A limitation of \$1,000 was placed on field procurement. Field Procurement was effected by placing a Demand, GFA ETO Form 101, with appropriate government authorities who then undertook the necessary dealings with the civilian supplies concerned. GFA ETO Form 102, titled "Mutual Aid Receipt" was used for receipt of deliveries. One copy of each form, 101 and 102, was forwarded to this office where the items were recorded on stock record cards. The amounts on stock record cards were used in reporting Summary Reports under Reciprocal Aid to France, Belgium, Luxembourg, and the Netherlands.

4. Headquarters Procurement in France, Belgium, Luxembourg, and the Netherlands was accomplished in compliance with the provisions of Part II of GFA Manual No. 1, dated 6 June 1945, as amended. This type of procurement was utilized for items procured for depot stock and issue over a considerable period of time and/or if the estimated amount was over \$1,000.00. Two items procured in this manner were 211,500 Patients Effects Bags from the French, and 118,975 packages of X-Ray film from the Belgians.

5. Reciprocal Aid Reports.

a. The quarterly Report of Reciprocal Aid received from the French Government for the period 1 April to 30 June 1945 showed that for this period medical supplies and equipment valued at \$36,860.00 had been received. This brought the total cumulative amount to \$52,615.43.

b. On 26 June, records and files pertinent to British Reciprocal Aid were brought over from the UK. The British report submitted for the quarterly period ending 30 June 1945 recorded the receipt of medical supplies, equipment, and services valued at \$433,677.47. The total cumulative value received since the inception of British Reciprocal Aid amounted to \$26,385,571.60.

c. Summary assistance received from the Belgian government through Reciprocal Aid during the last quarter of the fiscal year 1945 (1 April 1945 to 30 June 1945) amounted to \$185,225.37. Total cumulative amount received up to 30 June 1945 was \$185,592.92.

6. The Reports of Summary Assistance of Reciprocal Aid Received from the various allied governments for the first quarter of the fiscal year 1946 were broken down into two distinct and separate parts pursuant to IRS, Office of the Fiscal Director, Reciprocal Aid/Lend Lease Division, Hq TSFET (Near), subject, "Preparation of Summary Reports Under Reciprocal Aid" dated 9 October 1945. Part I of the Reports reflect the total amount of aid rendered by each of the various allied governments for the period 1 July 1945 to 2 September 1945, inclusive. Part II of the Reports reflect the amount of aid rendered by each of the various allied governments for the period 3 September 1945 to 30 September 1945.

a. Below is a listing of countries and dollar values of supplies reported in Parts I and II of Reciprocal Aid Reports for periods named above:

	This Period	Cumulative
Belgium:		
Part I	\$339,042.30	\$523,299.27
Part II	39.98	39.98
	<u>339,082.28</u>	
Luxembourg:		
Part I	383.72	565.73
Part II	Negative Report Submitted	
France:		
Part I	7,294.48	59,539.91
Part II	709.25	709.25
	<u>8,003.73</u>	
Britain:		
Part I	241,037.82	26,685,938.63
Part II	5,437.66	5,437.66
	<u>246,475.48</u>	

7. Transfer of medical supplies from U. S. Forces in the European Theater of Operations to the Canadian Government for reimbursement totaled \$3,197.26 as of 30 June 1945. No additional transfers to the Canadian Government have been recorded in this office.

8. Amounts of Lend Lease assistance rendered to various allied governments for the bi-monthly reports as of 30 June 1945 and 31 August 1945 is tabulated below in dollar values:

	1 May to 30 June 1945		1 July 1945 to 31 Aug 45	
	This period	To Date	This period	To Date
Belgium		382.02	156.41	538.43
Royal Netherlands	47,494.94	74,180.41	474.13	74,654.54

Russia	2,791.22	2,791.22		2,791.22
Czechoslovakia	No Report		249.55	249.55
Poland	No Report		1,502.51	1,502.51
France	107,986.51	244,981.35	32,755.02	277,736.37
Britain	4,921.79	722,245.12	1,214.19	723,459.31

9. Lend Lease Medical Supplies returned to U. S. Forces in the European Theater by the French Government amounted to \$116,673.55.

10. Funds appropriated by the War Department for expenditure for medical supplies are entitled Medical and Hospital Department Army Funds. In this theater, these funds were available thru the first quarter of the fiscal year 1946 for obligation in open amount, i.e. without limitation. Medical and Hospital Department, Army Funds obligated by the Theater Chief Surgeon for the Fiscal Year 1945 amounted to \$21,135.26. For the first quarter of the fiscal year 1946 \$36,547.68 was obligated from MHA Funds allotted to this office. Of this latter amount, the majority of it was obligated for Hoof and Mouth Disease Vaccine received from Switzerland.

11. As of 30 September 1945, FDGA 60-Funds, of which MHA Funds is a part, were withdrawn. Effective 1 October 1945 Overseas Sub-Allocation 60-Funds were made available to the Commanding General, Hq USFET, for expenditure in this Theater. The Chief Surgeon's Office was sub-allotted MHA Funds in the amount of \$50,000 for the second quarter, Fiscal Year 1946. In addition to this amount a reserve of \$19,300 is being held by the Fiscal Director for use if and when required.

12. Briefly the Finance Section received necessary vouchers for recording of all Reciprocal Aid, Lend Lease, Monthly Obligations, and Procurements Reports. Upon receipt of these vouchers they were processed on to the pertinent stock record cards and later reported in above reports.

SECTION - VI

MEDICAL SUPPLY ACTIVITIES
IN GERMANY

2 Exhibits

- Exhibit 1 - Captured Stock Catalog
- 2 - Technical Guide for the Issue of
Captured Medical Supplies to German
Civilians and Displaced Persons

1. GENERAL - Supply Division activities of a liaison nature started in Germany on 16 July 1945 with the assignment of two officers and three enlisted men. The mission was to coordinate the needs of an occupational supply system with a residual stock pile and a phasing out operation in the rear.

2. DEPOTS - A survey of depot facilities was instituted and an effort was made to re-establish the Weinheim Medical Depot in a location more suited for depot operations. No satisfactory progress was made, but G-4 was informed as to the very unsatisfactory situation at this depot and recommended in a G-4 inspection report that the depot remain in its present location until Spring, when efforts will be made to build a satisfactory depot installation. Other depot installations at Bremen, Furth and Berlin, were considered satisfactory. Recommendations were made and acted upon changing the operating personnel of the Bremen Medical Depot from a Depot Company T/O & E 8-667 to a Medical Base Depot Company T/O & E 8-187, augmented by German civilians.

3. STOCK CONTROL - Requirements were set up for transfer from rear stock piles of non-expendable supplies sufficient to establish 100-bed station hospitals in fixed installations for all field hospitals in the Occupational Troop Basis computed on the basis of breaking each field hospital into three operating sections. Details were worked out with professional and dental services for the augmentation of equipment in fixed hospitals and field units.

4. MILITARY GOVERNMENT SUPPLY - Immediate action was also undertaken to catalog all captured stocks so that using units in the field and interested staff sections would be guided by a uniform stock number and nomenclature. Although action toward this end was initiated in late July, it was not until 20 October that the catalogs (Exhibit 1) were printed in final form. This 90-day delay was attributable to the difficulty of identifying 6,400 German items; constantly changing personnel; lack of familiarity among American personnel with German stock and nomenclatures and printing priorities which precluded early publication after the draft was complete. With the publication of the catalog and the re-inventorying of all dumps in the U.S. Zone, this office was in a position to evaluate its assets and determine therefrom which stocks were excess, hence available for disposal to Military Government or as Reparations and Restitutions. Prior to publication of the catalog, a Technical Guide (Exhibit 2) was circulated by the Office of the Theater Chief Surgeon, outlining an interim issue procedure to be followed until such time as the catalog permitted a mass disposal at headquarters level. This technical guide authorized Regierungsbezirk Military Government Detachments to approve requisitions for captured supplies, and empowered Captured Dumps to make issues against their requisitions without resort to higher authority. Issues to POW inclosures from Captured Stock were subject to the approval of District Medical Supply Officers and were given priority over issues to Military Government. Captured stocks in the U.S. Zone were consolidated from nine (9) major installations at Heilbronn, Ganting, Ihringshausen, Neuhof, Straubing, Furth, Heidingsfeld, Treuen and Bad Mergentheim in July to six (6), the first six named, as of 30 September with an ultimate reduction to two of these foreseen. Tonnage on hand during that period was reduced from approximately 31,000 to 18,000 tons.

Minor installations were either depleted through issue or were consolidated with the six remaining dumps in order to conserve operating personnel and to pool assets. Issues of imported CA/MG supplies in Germany were almost negligible after July. Adequacy of captured stocks and indigenous resources accounted for this fact. Action of this office with these supplies was directed along two lines: (a) disposition of imported stocks, and (b) providing emergency deliveries to Military Government detachments. Authority was received from the AC/S G-4, TSFET (Main) to transfer all DDT powder, hand dusters and power dusters to the OCQM, thus placing the supplies with what is normally the issuing service. Approval was received from the AC/S G-5, USFET, to transfer into U.S. Army stocks all CAD Basic Medical Units remaining in France, whereas units already on hand in Germany will be retained as a theater reserve. This office made numerous emergency shipments of German-produced and captured supplies to Military Government detachments, particularly in Berlin and Austria. Initially requests were received through technical channels requesting immediate delivery, but thereafter such requisitions were cleared by USFET before delivery. Confusion as to requisitioning channels and an apparent inability to use normal German trade channels resulted in frequent instances in which this office served as a retail agent for German civilian demands. Progress was made with this problem as is evidenced by the fact that major commands such as Berlin, are now placing 6-months requirements instead of the former day-to-day demands, but further clarification of Military Government supply and requisitioning procedures is in order.
